22.3 Savings Goals 73
23. Legal Information and Version 75

1. Introduction to Pecule

Pecule is a personal finance management application designed exclusively for macOS. It lets you track your bank accounts, transactions, expense categories, payment methods, and recurring payment schedules — all within a native interface optimized for both Apple Silicon and Intel Macs.

1.1 Key Features

- Multi-account management (checking accounts, savings, etc.)
- Transaction entry and editing with split-line sub-operations
- Status system: Planned, In Progress, Executed
- Customizable payment methods (wire transfer, check, card, etc.)
- Advanced predicate-based filter (amount, date, category, label…)
- Recurring payment scheduler
- Numbered bank statements
- Reading PDF bank statements to create entries (supported banks: LCL, Société Générale)
- Transaction import in CSV, QIF and OFX formats
- CSV export compatible with Excel and Numbers
- Notes linked to accounts
- Attachments (receipts, invoices) on transactions
- Menu bar icon with quick entry; Siri, Spotlight and Shortcuts
- Multi-currency support (EUR, USD, GBP, etc.)
- Fully localized in French, English, and 6 other languages

1.2 System Requirements

Requirement	Minimum Value
Operating System	macOS 14 Sonoma or later
Processor	Apple Silicon (M1 and later) or Intel
RAM	4 GB minimum, 8 GB recommended
Disk Space	150 MB for the app + data
Screen Resolution	1280 × 800 minimum

2. Installation and First Launch

2.1 Installation

1. Download the .dmg file from the application website or the Mac App Store.
2. Open the .dmg file and drag the Pecule icon to the Applications folder.
3. On first launch, macOS may ask for confirmation — click "Open".
4. You arrive on the Welcome screen.

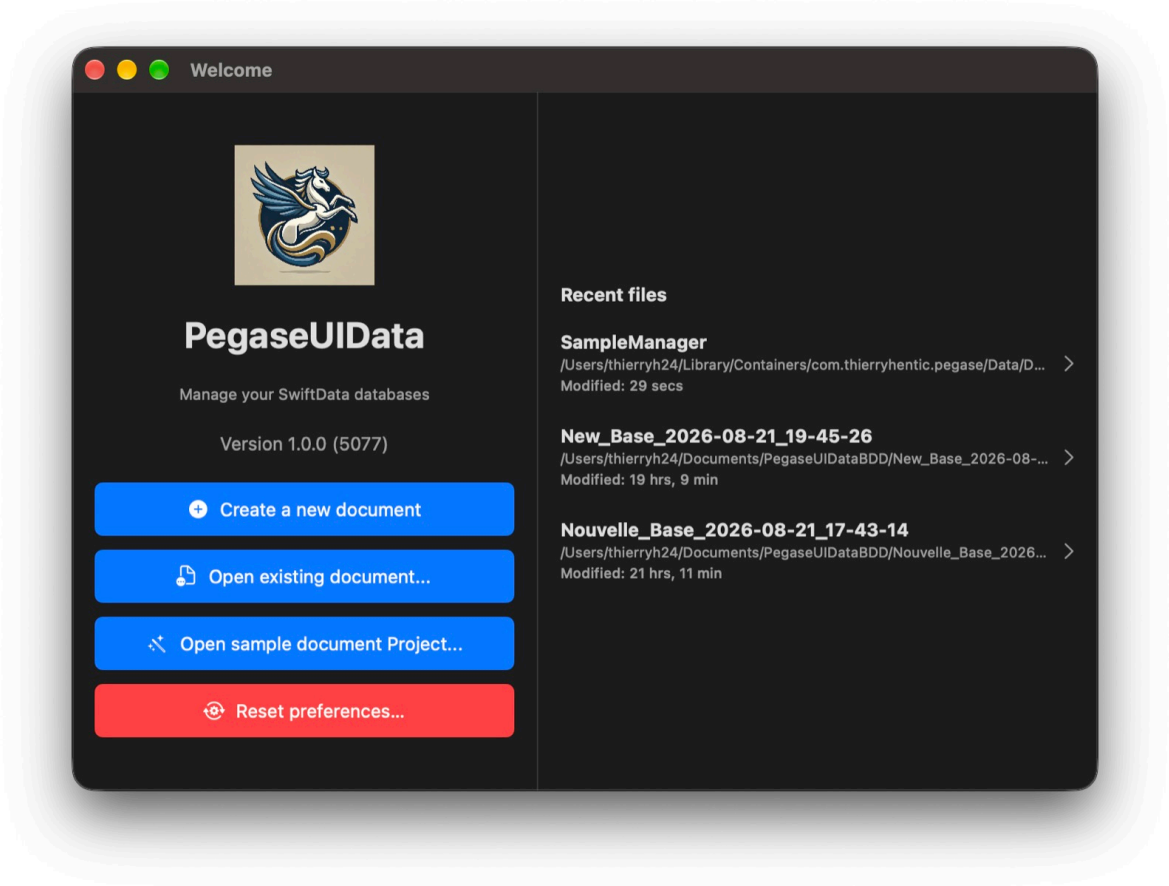

Figure: Pecule first startup

2.2 The Welcome Window

Pecule works with SwiftData database files (one file = one set of accounts). The Welcome window offers three actions on the left and a list of recent files on the right:

Button	Action
Create a new file	Creates a new database: empty with the setup assistant, or pre-filled with sample accounts (checkbox option)
Open existing document…	Opens an existing database file (.sqlite or proprietary format)

Open sample document…	Loads a pre-filled demo database to explore the application

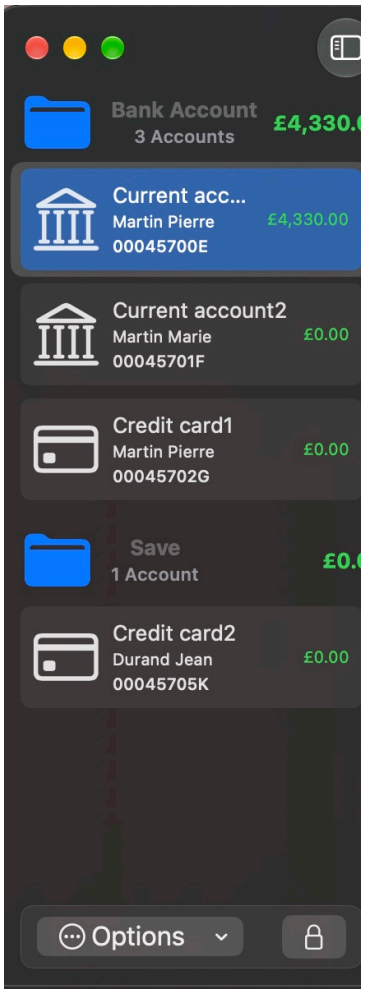

Figure: Welcome window — data file management

Recent Files

The right column shows recently opened files. Click a recent file to open it directly without going through the file picker.

To get started, click "Create a new file". Choose a folder: the name field is already pre-filled with a default name (which you can change) and the options are shown right away.

Two initialization modes, depending on the "Pre-fill with sample accounts" checkbox:

- Unticked (default): the database starts empty and the setup assistant guides you through creating your accounts.
- Ticked: the database is created immediately with default folders and accounts (checking account, savings, etc.), without the assistant.

2.3 Customizing the Default Accounts

If you ticked "Pre-fill with sample accounts", the default accounts appear in the sidebar. You can:

- Edit an account: right-click the account in the sidebar > "Edit Account".
- Change the icon: in account settings, select a new icon from the list.
- Add another account: click the "+" button at the top of the sidebar.
- Remove an unwanted account: right-click the account > Delete.

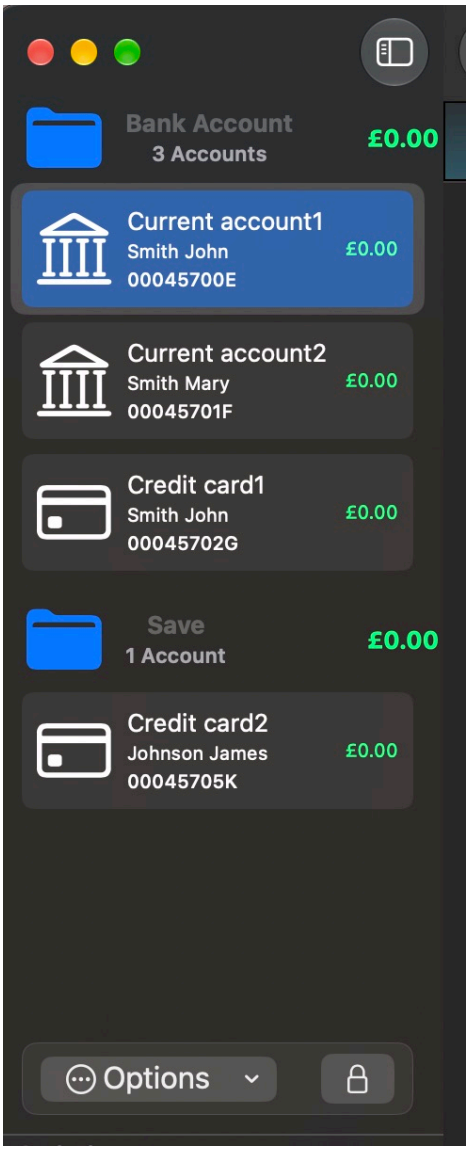

Figure: Default accounts after creating a new file

3. Interface Overview

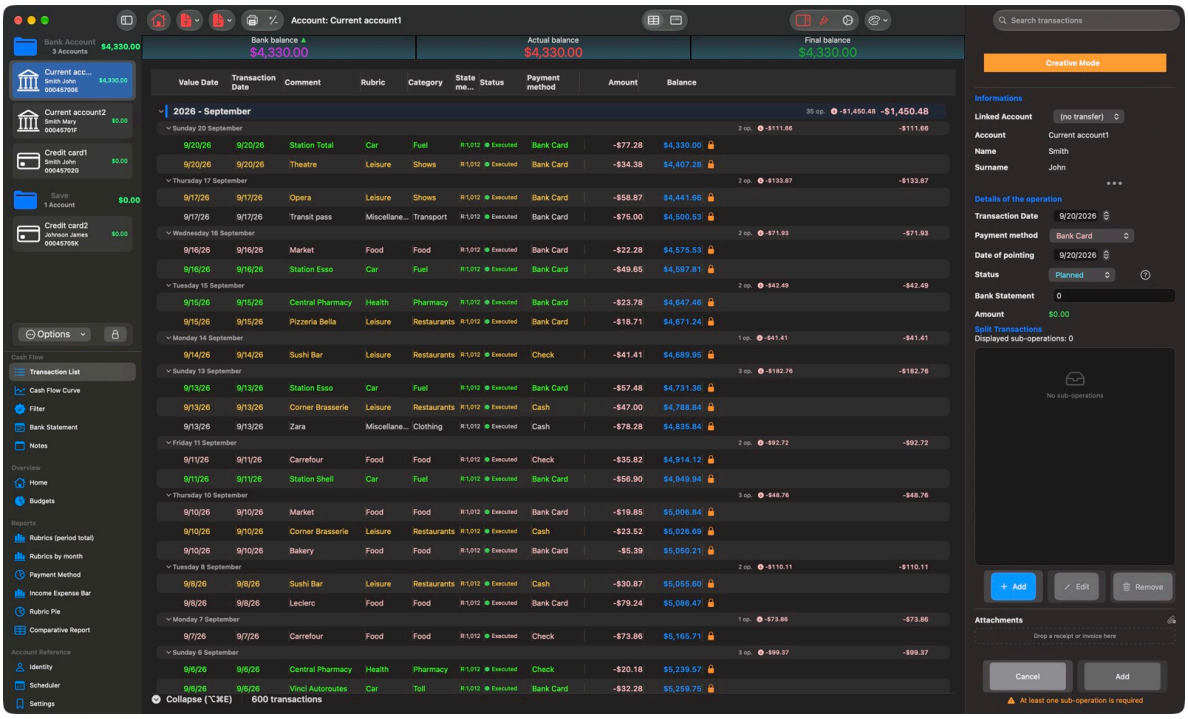

Figure: Main application view — the three columns

The Pecule interface is organized into three main columns:

- **Column 1 — Sidebar:** lists your accounts and provides navigation between views.
- **Column 2 — Main View:** transaction list, Filter view, Statement view, etc.
- **Column 3 — Entry Panel (OperationDialog):** form for creating and editing transactions.

3.1 The Sidebar

The sidebar is divided into two areas: the account list at the top, followed by the navigation sections below.

Section	Content
Accounts	Account folders and individual accounts. The folder balance is shown on the right; if its accounts are not in the same currency, a total is given per currency (for example “£4,330.00” and “US$1,200.00”). Click an account to display its transactions.
Treasury Tracking	Transaction List · Treasury Curve · Filter · Bank Statement · Notes
Synthesis	Home (account dashboard) · Budgets (budget tracking by rubric)

Reports	Rubrics (period total) · Rubrics by month · Payment Method · Income/Expense Bar · Income/Expense Pie · Rubric Pie · Comparative Report
Reference Account	Identities · Scheduler · Settings
Tools	Credit (loan simulator) · Stock (market tracking, directly distributed version only)

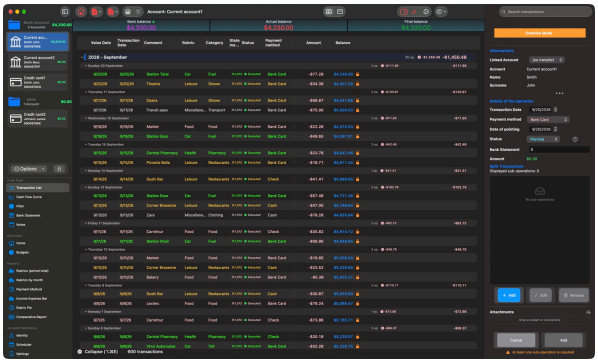

Figure: Sidebar — navigation and accounts

> **Lock Feature**
>
> The padlock button at the bottom of the sidebar locks the application on demand. The lock screen then offers an "Unlock" button (Touch ID, Face ID, or password). By default, locking is disabled (no authentication at launch); you can enable it in Preferences (Authorization tab).

3.2 The Main View

The center column — the main view — displays the list of transactions for the selected account. It consists of the balance dashboard (at the top) and the list of transactions, grouped by month in collapsible sections.

The dashboard (balances)

Three cards summarize the account. Each card shows a balance (its business meaning) and, as a subtitle, the status of the transactions that make it up:

- **Bank balance = Executed**: what is actually in the bank.
- **Actual balance = Executed + In progress**: bank + transactions being cleared.
- **Final balance = Executed + In progress + Planned**: full projection (planned transactions included).

The calculation and full correspondence are described in §7.6 "Dashboard".

The two display modes

A segmented control, centered in the toolbar, switches between two presentations:

- **Detailed table view (table icon):** all columns, with transactions grouped by month in collapsible sections. By default, only the last 12 months (and upcoming months) are expanded: click an older month to expand it, and Pecule remembers this choice.
- **Compact statement view (list icon):** a condensed presentation, grouped by day, like a bank statement.

Columns of the detailed table

The columns are configurable. The main ones:

- Pointage date (reconciliation date) and Transaction date
- Comment (transaction label)
- Rubric and Category
- Bank statement / Check number
- Status (Planned, In Progress, Executed)
- Payment method
- Amount
- Balance: the running balance, accumulated row by row

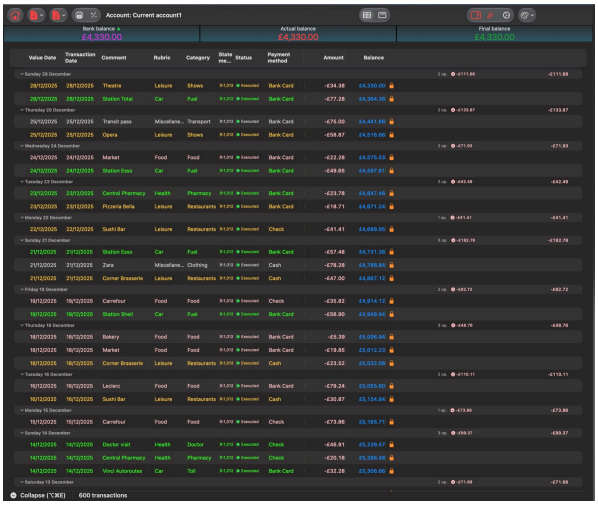

Figure: Main view — transaction list

3.3 The Entry Panel

The third column contains the transaction entry form, organized into sections:

- General information (dates, status, payment method, check number, statement number)
- Sub-operations: split the transaction into multiple lines (rubric, category, label, amount) — actions: Add, Edit, Delete
- Action buttons: Update, Add, Cancel

3.4 Appearance (theme and density)

The “Appearance” button in the toolbar opens a small panel:

- **Theme:** System (follows the macOS setting), Light or Dark. The whole row is clickable.
- **Display density:** Comfortable or Compact (row height in the list).

The change applies immediately, including to the colors of the transaction list.

3.5 The Menu Bar Icon

In the application menu, the “Menu bar icon” option adds a Pecule icon to the macOS menu bar. Its menu gives access, without opening the main window, to:

- **Balances:** the balance of each account and the total. Click an account to make it the target of quick entry.
- **Quick entry:** choose Expense or Income, enter the amount, the description and the category, then click “Add”.
- **Favorites:** your favorite transactions (the first five), added with one click.
- **Open Pecule:** brings the main window to the front.

3.6 Shortcuts, Siri and Spotlight

Three actions are available in Siri, Spotlight and the Shortcuts app:

- **Add an expense:** creates an expense in the account of your choice.
- **Account balance:** gives the balance of an account. If the application lock is enabled, Touch ID (or the password) is required.
- **Upcoming schedules:** lists the next scheduled payments.

Example phrase for Siri: “What is my balance in” followed by the application name.

4. Account Management

4.1 Create an Additional Account

Default accounts are automatically created when a new file is opened. To add another account:

1. Click the "+" button at the top of the sidebar.
2. Fill in the details: name, icon, currency, opening balance.
3. Optionally configure bank information: IBAN, BIC, bank name.
4. Click Save.

4.2 Edit an Account

Right-click the account in the sidebar and select "Edit Account". A form opens with the following fields:

- **Account Name:** name displayed in the sidebar.
- **Name / Surname:** account holder's identity.
- **Account Number:** short bank reference.
- **Icon:** SF symbol displayed next to the account — click "Choose an icon" to select one.

To access the full account settings (opening balance, IBAN, BIC, address, bank details…), use the "Reference Account" section in the sidebar (see §15.2).

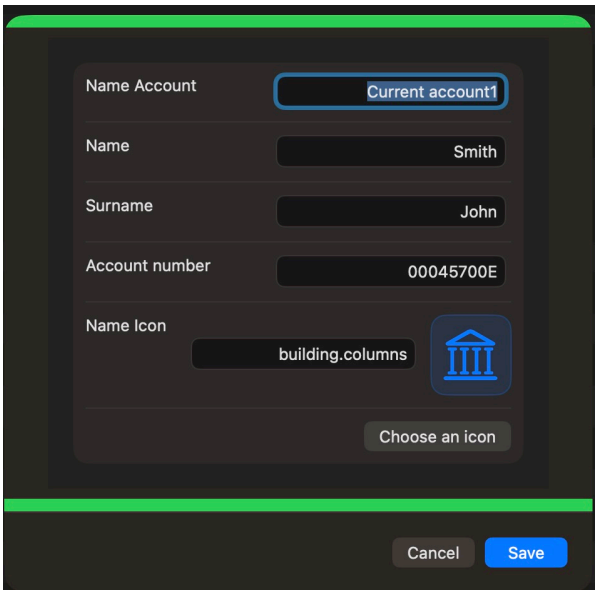

Figure: Edit account form

4.3 Delete an Account

! Warning

Deleting an account is irreversible. All associated transactions, sub-operations, bank statements, and scheduled payments will be permanently deleted.

Always export a CSV backup before deleting an account.

To delete an account, right-click it in the sidebar and select "Delete Account".

4.4 Switch Active Account

Simply click the desired account in the sidebar. The transaction list, entry panel, and all views update instantly to show data for the selected account.

Independent accounts

Each account is completely independent from the others. It has its own:

- Rubrics and categories
- Payment methods
- Opening balances (executed, committed, planned)
- Transaction history

Modifying the rubrics or payment methods of one account never affects any other account.

5. Transactions

5.1 Transaction Structure

Each transaction has two levels:

- **Transaction level:** operation date, reconciliation date, payment method, status, check number, statement number.
- **Sub-operations level:** one or more lines detailing the breakdown by rubric, category, label, and amount.

Split Transaction Principle

A transaction can be split into multiple sub-operations. For example, a $87.50 grocery purchase can be broken down into: Food $60, Personal Care $15, Household $12.50. The total transaction amount is the sum of all sub-operations.

5.2 Create a Transaction

1. Make sure no transaction is selected in the list (click an empty area to deselect, or click Cancel in the entry panel).
2. The entry panel switches to "Create" mode (Save / Cancel buttons active).
3. Enter the operation date and the reconciliation date.
4. Select the payment method from the dropdown.
5. Select the status (Planned, In Progress, Executed).

Tip

The payment method and status are pre-filled with the default values set in Preferences > Transactions tab. You can change them before saving.

1. Add at least one sub-operation by clicking the "+ Add" button.
2. In the sub-operation dialog: choose the rubric, category, enter a label, and the amount.

Tip

The rubric, category, and sign (+ or −) are pre-filled with the default values set in Preferences > Transactions tab.

1. Click OK to confirm the sub-operation.
2. Click Save to record the transaction.

5.4 Delete a Transaction

Select the transaction in the list, then:

- Use the context menu (right-click) > Delete, or
- Press Option + Backspace (⌥ ⌫) after selection.

! Warning

After confirmation, the transaction and all its sub-operations are deleted. You can undo the deletion with Edit › Undo (⌘Z), and redo it with ⇧⌘Z: the transactions come back unchanged (category, status, attachments, linked transfer). The undo history is cleared when the database is closed.

5.5 Duplicate a Transaction

Right-click the transaction > Duplicate. An identical copy is created with the same date, payment method, and sub-operations. You can then modify it as needed.

5.6 Cut / Copy / Paste

These actions are available in the context menu (right-click):

- **Cut:** copies the transaction to the clipboard and marks it for deletion.
- **Copy:** copies the transaction to the clipboard without deleting it.
- Paste: creates a new transaction from the clipboard, in the active account. You can therefore copy transactions from one account to another: rubric and category are matched by name in the destination account, and created if they do not exist there; the status is kept, and so is the payment method if it exists in that account (otherwise, the default method).
- If the destination account has another currency, Pecule asks for confirmation: amounts are pasted as they are, without conversion (for example £42.50 becomes US$42.50).
- Large volumes: from 500 transactions, pasting is done in batches of 1,000, with a “Paste in progress” window showing the progress. For a cut and paste, the originals are then deleted, also in batches. If an error occurs, the batches already pasted are kept.
- Undo: a paste or a cut and paste is undone with Edit > Undo (⌘Z) and redone with ⇧⌘Z. The pasted copies are deleted and, for a cut, the originals return to their account unchanged (category, status, attachments, linked transfer). Above 500 transactions, a window shows the progress.

5.7 Attachments

Each transaction can carry attachments (receipt, invoice, PDF, image), including while it is being created: they are then saved with the transaction. The “Attachments” section is in the entry panel.

- **Add:** drag a file onto the “Drop a receipt or invoice here” area, or click the paperclip button of the section.
- **View:** click an attachment to preview it (Quick Look).
- **Other actions:** right-click the attachment > Quick Look, Open, Save As… or Delete.

In the transaction list, a paperclip marks the transactions that have attachments.

6. Sub-operations and Split Transactions

6.1 Overview

Splitting allows you to break a transaction into multiple accounting lines. Each sub-operation belongs to a rubric and a category, and has its own label and amount.

Example: a $150 check covering both an electricity bill and internet service can be split as:

- Rubric Housing > Category Electricity: $95
- Rubric Housing > Category Internet: $55

6.2 Add a Sub-operation

1. In the entry panel, click the "+ Add" button in the Sub-operations section.
2. The sub-operation dialog opens.
3. Select the rubric from the first dropdown.
4. The category list filters automatically based on the chosen rubric.
5. Select the category.
6. Enter a label (expense description).
7. Enter the amount (positive for credit, negative for debit).
8. Click OK.

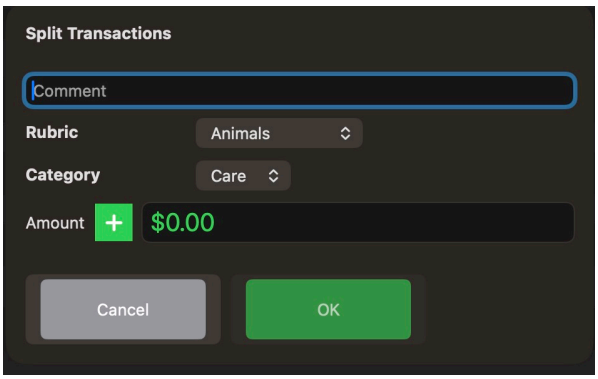

Figure: Sub-operation entry dialog

6.3 Edit a Sub-operation

Double-click the sub-operation row in the entry panel list to open the edit dialog.

6.4 Delete a Sub-operation

Select the sub-operation (single click) in the list, then click the "Remove" button (trash icon) located below the list, in the Add / Edit / Remove button row.

6.5 Total and Validation

The total transaction amount is automatically recalculated each time a sub-operation is added, edited, or removed. The number of sub-operations is displayed above the list.

6.6 Spotting a Split Transaction in the List

In the transaction list, a split transaction shows a “+N” badge after its label: N is the number of sub-operations in addition to the first one.

- **Details:** hover over the row to see each sub-operation (label, rubric / category, amount).
- **“Split”:** when the sub-operations do not all share the same rubric or category, the Rubric and Category columns show “Split”.

7. Treasury Curve

The Treasury Curve is an interactive line chart that shows the projected evolution of your account balance over time, distinguishing three levels of certainty.

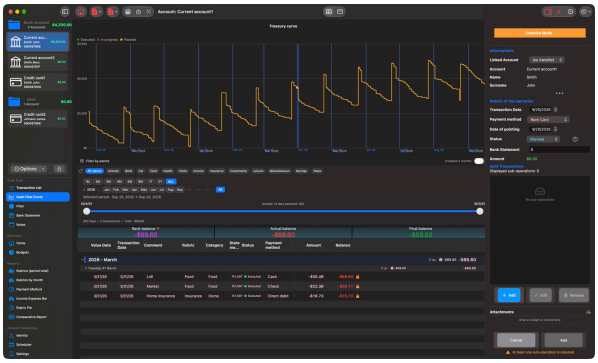

Figure: Treasury Curve — balance evolution over time

7.1 Accessing the Curve

Click "Treasury Curve" in the sidebar under the active account.

7.2 The Three Curves

The chart displays three cumulative curves calculated from the account's transactions:

Curve	Description
Executed	Cumulative balance of transactions with status "Executed". Represents what has actually cleared the bank.
Committed	Executed + "In Progress" transactions. Balance including engaged operations not yet cleared.
Planned	Committed + "Planned" transactions. Full projection including all future scheduled operations.

Over a period longer than two years, a marker shows each 1 January (instead of each start of month) and the curve is simplified to stay smooth; on hover, the bubble still shows the exact balance of the day.

7.3 Filtering by Period

The "Filter by period" panel combines two complementary tools:

Preset period buttons let you instantly position the range:

- **1M, 2M, 3M, 4M, 5M, 6M:** displays the last N months up to the most recent transaction.
- **1A, 2A:** displays the last one or two years.
- **ALL:** selected by default — displays all available transactions.

The range slider lets you fine-tune the period manually:

- **Left handle:** sets the start date.
- **Right handle:** sets the end date.

Below the slider, a summary line shows: the start date → end date, the number of days covered, the number of transactions in the range, and their total.

The panel collapses with the chevron to the left of its title, to give the chart more room: its header then reminds you of the period shown (for example “1 Jan 2016 → 30 Sep 2026”) and keeps the “Compare 2 months” switch. Pecule remembers this choice, and the selected period is kept when you expand it again.

> **Tip**
>
> Moving the slider while a day is selected on the chart automatically cancels that selection and clears the transaction list.

7.4 Filtering by Rubric

Above the chart, a row of buttons (tag icon) lets you restrict the curve and the transaction list to a single rubric. The "All rubrics" button, selected by default, shows every operation; click a rubric name to display only its contribution to the cash flow. Both the curve and the list below update instantly, and this filter stays active in normal mode as well as in the two-month comparison mode.

When a single rubric is selected, the curve starts from zero: since the account's initial balance is not broken down by rubric, the curve then represents only the cumulative amounts of the chosen rubric over the period. Switch back to "All rubrics" to return to the overall cash flow, initial balances included.

7.5 Selecting a Day on the Chart

Click a point on the chart to display the transactions for that specific day in the list view below the curve. The list shows the same columns and options as the main view (context menu, edit, duplicate…).

Click outside a point to deselect and clear the list.

7.6 Dashboard

When a day is selected on the chart, the dashboard values reflect that day's transactions, cumulated with the account's initial balances:

- **Executed:** "Executed" transactions for the selected day + initial executed balance.
- **In progress:** executed + "In Progress" transactions for the selected day + initial in progress balance.
- **Planned:** in progress + "Planned" transactions for the selected day + initial planned balance.

When no day is selected, the dashboard displays only the account's initial balances.

Correspondence with the displayed balance labels:

- **Executed** → **Bank balance:** what is actually in the bank (executed transactions + initial balance).
- **In progress** → **Actual balance:** executed + transactions being cleared.
- **Planned** → **Final balance:** projection including planned transactions.

Concrete example — the life cycle of a €100 expense:

- **1. Planned:** you plan a €100 expense (the transaction is entered, but nothing is committed yet). It counts toward the final balance.
- **2. In progress:** you write a cheque (or use another payment method) and hand it to the merchant. The money will leave your account but hasn't been debited yet: the transaction moves to "In progress" and counts toward the actual balance.
- **3. Executed:** the merchant deposits the cheque, the bank clears it and actually debits your account. The transaction becomes "Executed" and counts toward the bank balance.

Through these steps you simply change the transaction's status (Planned → In progress → Executed); the dashboard's three balances update automatically.

7.7 Print

Click the "Print" button (printer icon) in the main toolbar to print or export the curve as a PDF.

8. The Filter View (Advanced Search)

The Filter view allows you to search for transactions using combinable criteria: amount, date, category, payment method, label, status, statement number, etc.

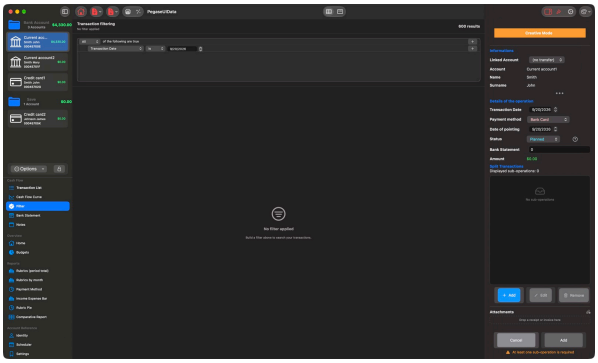

Figure: Filter view — predicate editor and results

8.1 Open the Filter View

Click "Filter" in the sidebar under the active account.

8.2 Build a Filter

1. In the predicate editor (top section), click "+" to add a rule.
2. Choose the field to filter in the first dropdown (Amount, Date, Label, Status…).
3. Choose the operator depending on the field: equals, contains, begins with, is greater than, is before, is after…
4. Enter the comparison value.
5. Repeat to add more rules. Choose whether all rules must match (AND) or at least one (OR).

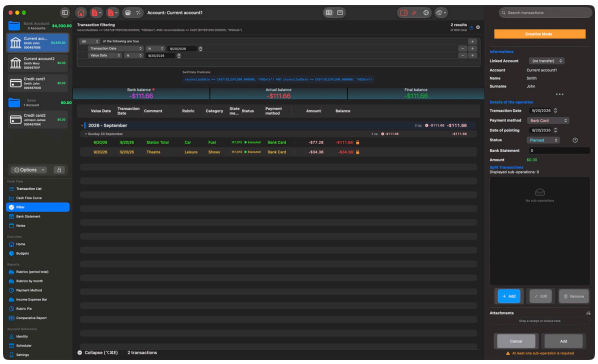

Figure: Building a multi-criteria filter

8.3 Results and Actions

Transactions matching the filter appear in the list below. The header shows the number of results and the total number of transactions.

From the results list, you can:

- Select a transaction (it loads in the entry panel for editing)
- Double-click to open the detailed view
- Right-click to access the full context menu

8.4 Context Menu in the Filter View

The context menu (right-click) on a filtered transaction offers the same actions as in the main view:

- Show Details
- Change Pointing Date
- Change Payment Method
- Change Status
- Change Bank Statement
- Cut / Copy / Paste
- Duplicate
- Create Scheduled Payment
- Delete

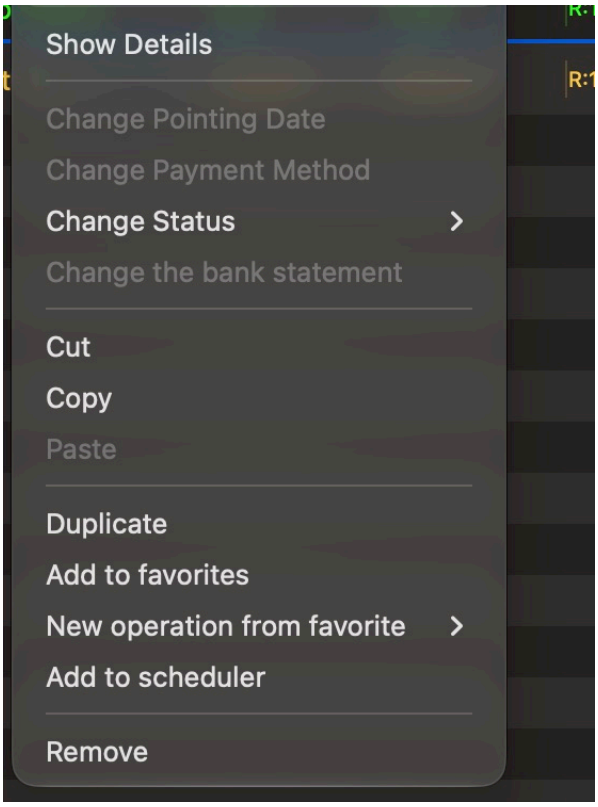

Figure: Context menu in the Filter view

8.5 Clear the Filter

Click the "×" (circle with cross) button in the upper right corner of the header to clear the filter: all rules in the editor are removed and all account transactions become visible again.

9. The Bank Statement View

The Bank Statement view lets you manage reconciliation between your transactions and your bank statements. It is divided into two vertical areas:

- **Top:** a table listing all your bank statements.
- **Bottom:** the transactions belonging to the selected statement.

9.1 The Statement Table

The table lists all bank statements for the selected account. Each statement corresponds to a period defined by your bank — typically one month — and groups the transactions assigned to it. It spans the full width of the window; its columns widen with it.

A statement can include up to three balance checkpoints, enabling precise tracking, particularly for accounts with deferred credit cards. Each row shows:

- **N°** — statement identifier number.
- **Start Date · Initial balance** — opening date and opening balance of the statement.
- **Intermediate Date · Intermediate balance** — optional mid-period checkpoint.
- **End Date · End balance** — closing date and declared end-of-statement balance.
- **CB Date · CB balance** — for accounts with a deferred credit card: the card date and balance.
- **✓ / ✗ indicator** — green if the sum of executed transactions matches the declared end balance, red otherwise. This indicator lets you instantly spot any discrepancy between your records and the official statement.

Click a row to select a statement: its transactions appear immediately in the lower area of the view.

9.2 Assign a Statement to a Transaction

The statement number for a transaction is entered in the right-hand panel, in the "Bank Statement" field, when creating or editing the transaction.

10. Notes

The Notes view lets you associate text memos with an account. Useful for storing contract numbers, reminders, loan conditions, etc.

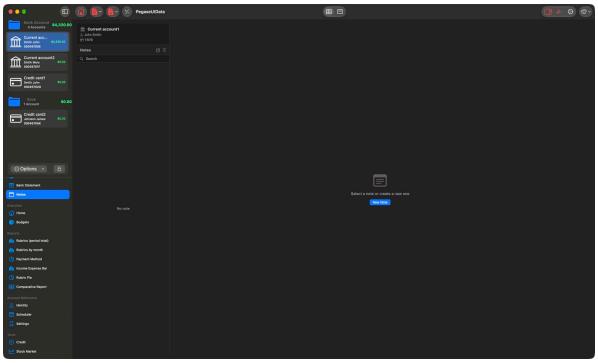

Figure: Notes view — list and editor

10.1 Create a Note

1. Click "Notes" in the sidebar.
2. Click "+ New Note".
3. Enter a title and the note content.
4. The note is automatically saved.

10.2 Delete a Note

Select the note in the list and click the "Delete" button (trash icon), or press the Backspace (⌫) key.

11. Reports and Charts

Pecule includes a comprehensive reporting module that lets you analyze your finances visually through interactive tables and charts. All reports update automatically when you switch accounts and can be printed or exported as PDF.

11.1 Accessing Reports

Reports are accessible from the sidebar. Click the "Reports" entry under the active account. A selector at the top of the view lets you choose which type of report to display.

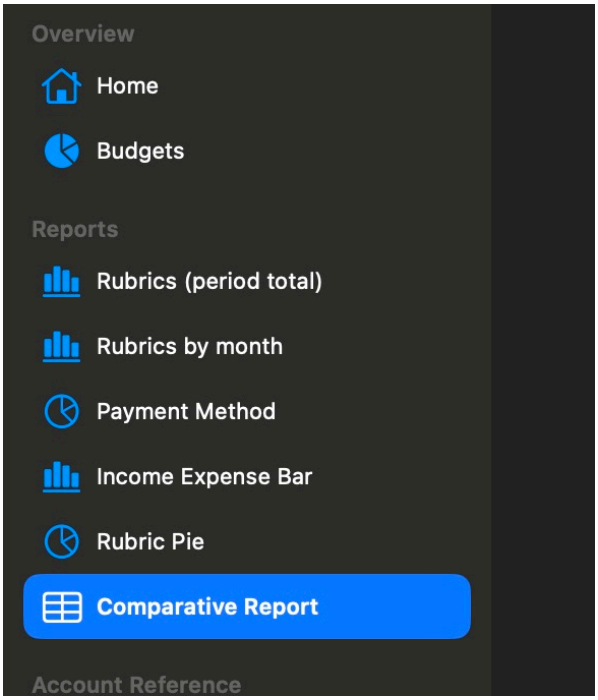

Figure: Navigating to reports

11.2 Filtering by Period

All reports share the same time filter panel, combining two complementary tools:

Preset period buttons let you position the range instantly:

- **1M, 2M, 3M, 4M, 5M, 6M:** displays the last N months up to the most recent transaction.
- **1A, 2A:** displays the last one or two years.
- **ALL:** selected by default — covers all available transactions.

The range slider lets you fine-tune the period manually:

- **Left handle:** sets the start date.
- **Right handle:** sets the end date.

The line below the slider shows the selected range (start date → end date). The chart recalculates instantly with every change.

The panel collapses with the chevron to the left of its title: only the header remains, reminding you of the period shown, and the transaction table stays visible. This choice is remembered and shared by all reports; the cash flow curve has its own (see 7.3).

> **Tip**
>
> To analyze the last full year, click "1A". For the last quarter, use "3M".

11.3 Charts

The Charts section groups all diagrams available in the sidebar, listed in the same order as the menu. Each chart shares the same period filter panel described in §11.2.

11.3.1 Rubrics (period total)

One bar per rubric, representing the total for the displayed period. Bars are colored according to each rubric's color.

- Click a bar to filter transactions for that rubric in the list; click the same bar again to clear the selection.
- Hover over a bar to see the exact amount in a tooltip.

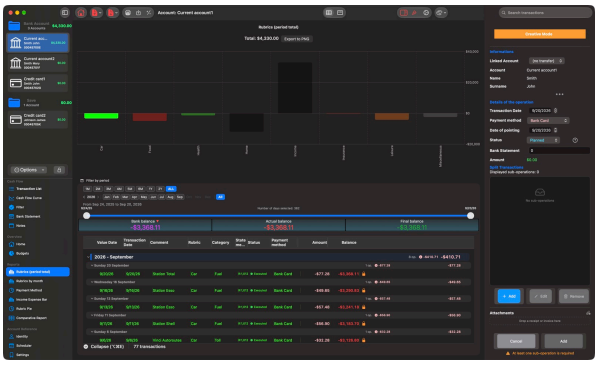

Figure: Rubrics (period total)

11.3.2 Rubrics by month

Grouped bars by month, with one series per rubric: the monthly evolution of each rubric's amounts. The rubric legend below the chart is clickable to isolate a single rubric.

- Click a month to filter that month's transactions; click a rubric in the legend to filter by rubric. Click again to clear.

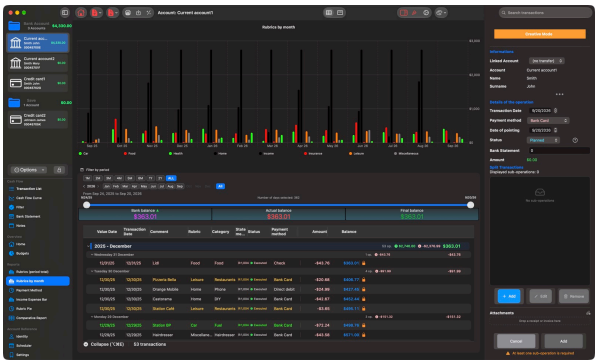

Figure: Rubrics by month

11.3.3 Payment Method Pie Chart

Distribution of transactions by payment method used (card, wire transfer, check, direct debit, cash…). Each slice uses the payment method's color defined for the account. Useful for analyzing your payment habits.

- Click a slice to display matching transactions in the list below the filter panel; click the same slice again to clear the selection.
- Drag the pie chart to rotate it manually. It appears with a short entrance animation when opened.

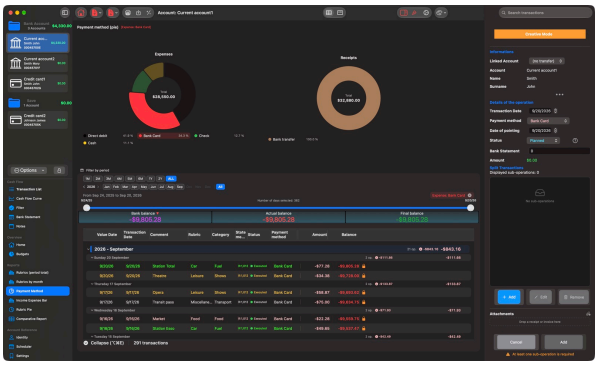

Figure: Payment Method Pie Chart

11.3.4 Income / Expense Bar Chart

Income and expenses month by month as grouped bars: for each month, the income bar and the expense bar sit side by side. Lets you visualize the temporal evolution of the balance.

- Click the income bar or the expense bar of a month to display, in the list, only the matching transactions (that month's income or expenses).
- Click the same bar again to clear the selection.

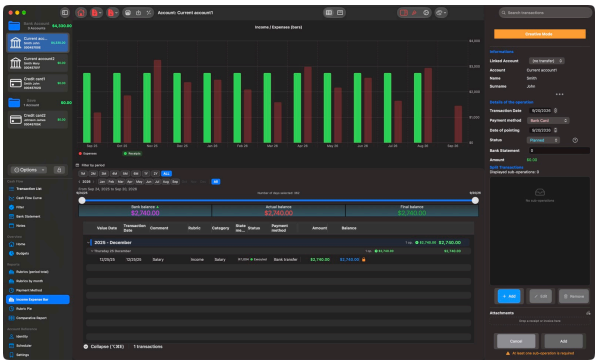

Figure: Monthly Income / Expense Bar Chart

11.3.5 Rubric Pie Chart

Amount breakdown by rubric over the selected period. Two side-by-side charts: expenses (negative amounts) on the left, income (positive amounts) on the right. Each slice is colored according to the rubric's color defined in account settings.

- Click a slice to display the matching transactions in the list below the filter panel; click the same slice again to clear the selection.
- Drag a pie chart to rotate it manually. They appear with a short entrance animation when opened.
- If no data exists for one direction, the corresponding chart displays an informational message.

The smallest slices are grouped into an “Others” slice (Payment Method and Rubric pie charts). Click it to show the details of the corresponding transactions.

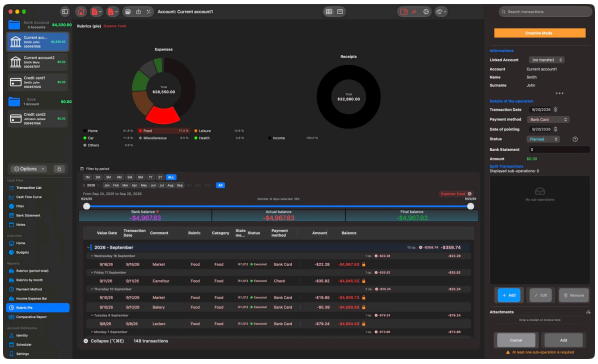

Figure: Rubric Pie Chart — expense and income breakdown

11.4 Monthly Comparative Report

This report presents a comparative table for analyzing amounts by rubric and by month over the selected period. It is ideal for identifying monthly trends, spending peaks, and budget drift. The table scrolls horizontally for long periods and automatically adapts its colors to macOS dark mode.

11.4.1 Fixed columns (per rubric)

Column	Content
Swatch + Rubric	Rubric name preceded by a color swatch (color defined in account settings).
Month (e.g. May 2025)	Total amount of sub-operations for this rubric in that month. Positive in black, negative in red. Blank if zero.
Total	Sum of all months for this rubric. Negative amounts shown in red.
Max	Highest non-zero monthly amount for this rubric. Shown in orange.
Min	Lowest non-zero monthly amount for this rubric. Shown in blue.
Nb	Total number of sub-operations for this rubric over the entire period.
Nb+	Number of credit sub-operations (positive amount). Shown in green.
Nb−	Number of debit sub-operations (negative amount). Shown in red.
Tx+	Number of credit parent transactions (deduplicated). Shown in green.
Tx−	Number of debit parent transactions (deduplicated). Shown in red.

11.4.2 Summary rows

Seven summary rows appear below the rubric rows, each with a distinctive background color:

Row	Content
Total	Sum of all rubrics, month by month. Accent background, bold text.
Average	Monthly average across all rubrics for each month.
Max	Highest amount across all rubrics, month by month. Light orange background.
Min	Lowest amount across all rubrics, month by month. Light blue background.
Nb transactions	Total number of sub-operations per month, across all rubrics.
Tx credit	Number of credit parent transactions per month (deduplicated). Light green background.
Tx debit	Number of debit parent transactions per month (deduplicated). Light red background.

Selection

Only rubric rows are selectable (click to highlight). Summary rows cannot be selected.

Rows display in alternating colors (macOS system colors), adapted to both light and dark mode.

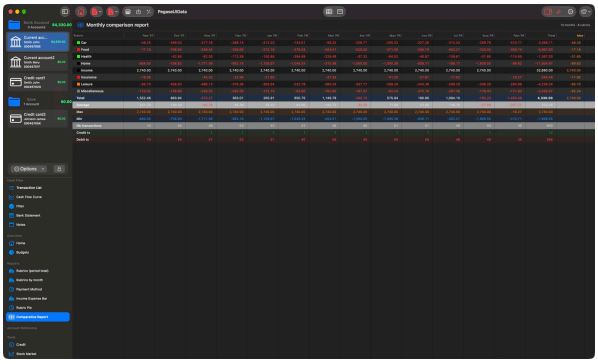

Figure: Monthly comparative report — enriched cross-tabulation (Max, Min, Nb, Tx+, Tx−)

11.5 Print or Export a Report

All reports can be printed or saved as PDF using the macOS print function.

1. Display the desired report with the target date range.
2. Press ⌘P or use the File > Print menu.
3. The macOS print dialog opens with a preview of the report.
4. To save as PDF: click "PDF" at the bottom left of the print dialog > Save as PDF.
5. Choose the location and file name, then click Save.

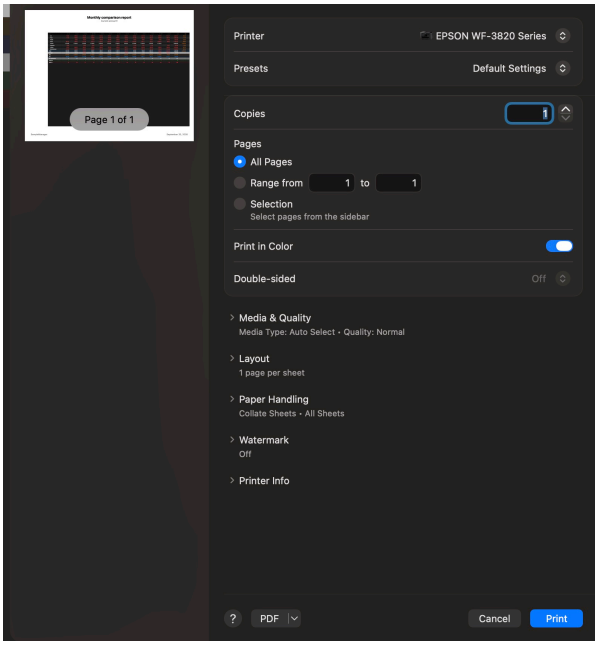

Figure: Printing a report — macOS dialog

PDF Export Tip

PDF export is the best way to share or archive a report. The generated PDF faithfully preserves the report layout, including chart colors.

You can also use Cmd+Shift+5 to capture the report screen using the macOS screenshot tool.

11.6 Annual Report

The annual report (sidebar › Reports › Annual report) summarizes one year and compares it with the previous year, on A4 pages. At the top right, “Accounts” chooses what is covered: “This account” (the selected account), the account's folder (for example “Savings”, when it holds several accounts) or “All accounts”; the choice is remembered. Then choose the year: only years with transactions are offered. For the current year, the period runs from January 1 to today and is compared with the same period of the previous year.

- **Summary:** income, expenses, net for the period, savings rate (share of income kept) and balance at the end of the period, each with the previous year's value and the change, in green when favorable, in red otherwise. Once two previous years have transactions, the tiles (except the balance at the end of the period) also show their average over the same period, for example “Avg 2021–2025: €23,000”.
- **Monthly expenses:** a chart compares the two years' expenses month by month; it is followed by a month-by-month table (income, expenses, net) with the total.
- **Evolution (page 2, once two years have transactions):** a chart and a year-by-year table, up to ten years ending with the selected year: income, expenses, net, savings rate and balance at end of year. The report's year is highlighted, the “Average” row covers complete years only and the current, partial year is marked with an asterisk.
- **Rubrics:** expenses and income by rubric, with the change and each rubric's share; beyond fourteen expense rubrics (six income rubrics), the rest are grouped under “Others”.
- **Top categories:** the year's ten largest expense categories.
- **By account (several accounts, last page):** income, expenses and net for the period of each account, with its year-end balance and the previous year's. Accounts kept in another currency are not added up: they are listed at the bottom of the page.

Example: with €24,000 of income and €21,600 of expenses, the net for the period is €2,400 and the savings rate 10%. If expenses were €20,000 the previous year, the Expenses tile shows +8% in red.

For several accounts, transfers between these accounts count neither as income nor as expenses: a €300 transfer from the current account to the savings account moves money without spending it. The total excluded is shown at the bottom of the rubrics page. A transfer to an account outside the report remains an expense.

If the previous year has no transactions (for example an account's first year), comparisons are hidden: the tiles, chart and tables only show the selected year, and a note says so.

The Print and Export PDF buttons of the toolbar print or save exactly the pages shown, to archive them or attach them to a file. Income and expenses include all transactions by pointing date; for a single account, transfers to other accounts are included.

12. Categories and Rubrics

Expense organization uses a two-level hierarchy:

- **Rubric:** top level (e.g., Food, Housing, Transportation).
- **Category:** sub-level linked to a rubric (e.g., Housing > Rent, Housing > Electricity).

12.1 Manage Rubrics

Access rubrics via Account Settings > Rubrics.

1. Click "+" to add a rubric.
2. Enter the name and choose a color (used in charts).
3. Click Save.

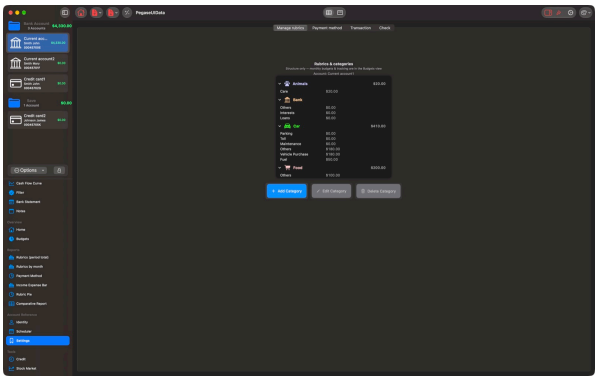

Figure: Managing rubrics

For the color, twelve predefined swatches can be picked with one click; “Custom color” opens the free color picker. The same palette is offered for payment methods.

12.2 Manage Categories

Each rubric contains categories, shown under it with their monthly target. Select a category to edit or delete it; to move it to another rubric, see 15.2.1.

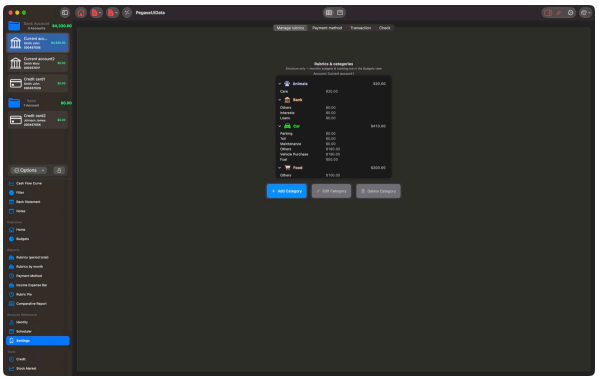

Figure: Managing categories for a rubric

13. The Scheduler (Recurring Payments)

The Scheduler manages recurring payments: rent, salary, subscriptions, loan repayments, etc. Scheduled transactions can be generated automatically when their due date arrives. The schedule list spans the full width of the window: the Comment column widens with it.

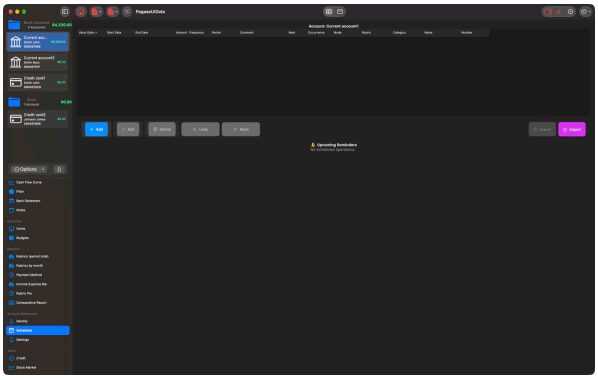

Figure: Scheduler view — list of scheduled payments

13.1 Create a Recurring Payment

1. Open the Scheduler from the sidebar.
2. Click "+ Add" to create a new scheduled payment.
3. Enter the name (e.g., "Rent"), start date, and frequency (monthly, weekly, annually…).
4. Set the amount, rubric, category, and payment method.
5. For a scheduled transfer (to a savings account, for example), choose the receiving account in “Linked Account” at the top of the form; otherwise leave “(no transfer)”. Each occurrence then also creates the opposite transaction in that account, linked to the first one: the ↗️ / ↙️ transfer icon appears in both accounts' transaction lists and before the label in the Scheduler. Only accounts in the same currency are offered.
6. Click Save.

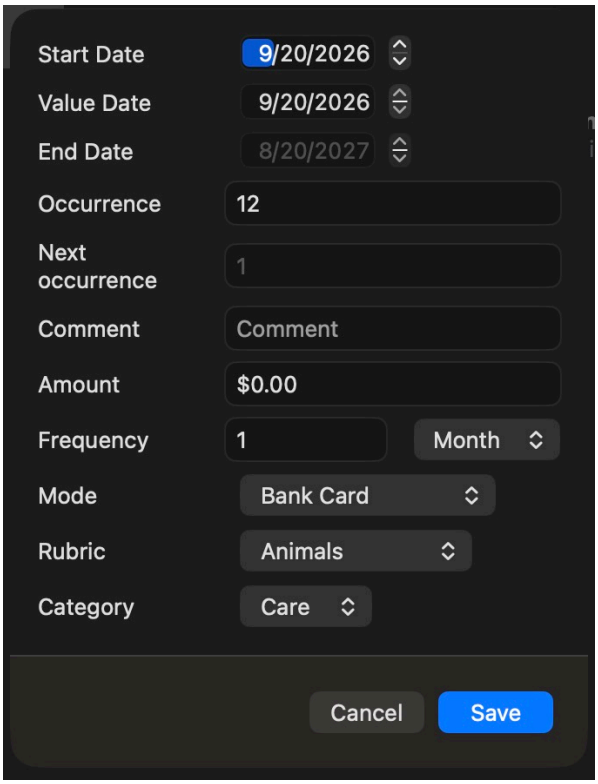

Figure: Creating a recurring payment

Terminology: in the Scheduler, a schedule's “Value Date” is the future “Pointage date” (reconciliation date) of the transaction that will be generated.

13.2 Create a Schedule from an Existing Transaction

Right-click a transaction in the list > "Create Scheduled Payment". The scheduler form opens pre-filled with the transaction's data.

13.3 Generate Transactions

Transaction generation is fully automatic: each time the Scheduler view is opened, all overdue schedules are automatically converted into transactions (see section 10.5 Upcoming Reminders).

The toolbar buttons available in the Scheduler view are:

- Add — create a new scheduled payment
- Edit — modify the selected schedule
- Delete — remove the selected schedule, or all selected schedules
- Undo / Redo — revert or restore the last action
- Export — export the list as a CSV file
- Import — import schedules from a CSV file

13.4 Edit or Delete a Schedule

1. Select a schedule in the list.

2. Click the ✏️ "Edit" button to modify the selected schedule.
3. To delete it, click the "Delete" button.
4. To delete several schedules at once, select them first: ⌘-click adds or removes a row, ⇧-click selects every row between the last clicked row and this one, in the displayed sort order. Then click "Delete" and confirm "Delete N schedules?". Reminders for those schedules are cancelled.

Already generated transactions are not affected. When several rows are selected, the "Edit" button is disabled; a multiple deletion is reverted in one step with "Undo".

13.5 Upcoming Reminders

The "▶️ Upcoming Reminders" section, displayed below the scheduler table, lists all pending scheduled payments not yet processed. The following rules apply:

13.5.1 Display

- **All future unprocessed schedules** (value date ≥ today) are shown, sorted chronologically.
- ● **Red / !:** due today or tomorrow — the row appears in bold.
- ◆ **Orange:** due within 7 days.
- ■ **Green:** due in more than 7 days.
- A relative label is shown: Today, Tomorrow, In X days (up to 6 days), then the date only.

13.5.2 Automatic Processing

- Each time the Scheduler view opens, all overdue or today-due unprocessed schedules are automatically converted into transactions.
- A system notification is sent to confirm the transaction was created.
- The same check runs again whenever the schedule list is updated.

13.5.3 System Notifications

The app sends two types of macOS notifications:

- **Reminder before due date:** a notification is automatically scheduled 1 day before each schedule's value date. It is dismissed as soon as the schedule is converted into a transaction.
- **Creation confirmation:** as soon as a schedule is converted into a transaction, a notification confirms the creation with the description and amount.
- **At app launch:** all reminder notifications are rescheduled for future unprocessed schedules, to prevent any loss after a restart.

> **Tip**
>
> If a schedule does not appear in the reminders list, it has likely already been automatically converted into a transaction — check your transaction list for that date. Otherwise, make sure its value date is set in the future.

13.6 Detected Regular Transactions

Pecule spots the regular payments (subscriptions, bills, bank fees…) and the regular income (salary, pension, benefits, rent received…) of the account that are not scheduled yet, and suggests them in the “Detected regular transactions” box, shown below the Scheduler buttons. The box only appears when there are suggestions. A payment is suggested when:

- **Same label:** the transactions share the same label, ignoring changing digits (dates, references);
- **At least 3 times:** the transaction appears at least three times, in the same direction (expenses and income are kept apart); the amount shows in red for an expense, in green for income;
- **Regular rhythm:** weekly, monthly, every two months, quarterly, every six months or yearly;
- **Stable amount:** each amount stays within 15% of the average (energy or water bills, or a variable salary);
- **Still active:** the last occurrence is less than one and a half periods old — a cancelled subscription is not suggested;
- **Not scheduled yet:** no schedule already has this label.

Each suggestion shows the label, amount, rhythm, number of occurrences and next expected date. “Create schedule” opens the schedule form pre-filled (label, amount, payment method, category, rhythm and next date): just check it and save. “Ignore” hides the suggestion for this account. Nothing is ever created automatically.

Labels truncated by the bank (“DIRECT DEBIT INSURANCE” then “DIRECT DEBIT INSURANCE H”) are recognized as the same transaction, and several payments with the same label on the same day (for example two pensions or two insurance policies) form separate series.

A schedule already created under another name is recognized (same direction, similar amount, same day of the month): the transaction is not suggested again. If its amount no longer matches the latest payments (pension increase, higher subscription fee…), the box flags it in orange — “Schedule “Internet box” (€29.99) no longer matches the latest payments” — and “Update schedule” opens the schedule with the new amount.

13.7 Regular Income, Fixed Expenses and Amount Left to Live On

Below the schedule table and its buttons, a banner sums up your recurring commitments, converted to a monthly amount:

- **Regular income:** the total of income schedules (salary, pension, benefits…);
- **Fixed expenses:** the total of expense schedules (rent, energy, insurance, loans…);
- **Left to live on:** the difference, in green when positive, in red otherwise.

Each schedule counts according to its rhythm: a quarterly one for a third, a yearly one for a twelfth, a weekly one for 52/12. Only ongoing schedules are included; hovering over a total shows how many schedules it covers.

13.8 Balance Projection

Below this banner, the “Balance projection” section draws the expected evolution of the account balance, day by day, over 3, 6 or 12 months (selector to the right of the title). The calculation starts from today's balance (including the account's opening balance) and adds:

- **Future transactions:** transactions already entered with an upcoming date (for example with the Planned status);

- **Active schedules:** their next occurrences, according to their rhythm, the number of remaining occurrences and their end date.

A dashed red line marks zero. Above the chart, a sentence tells you the first day the balance would turn negative (also shown by a red dot on the curve) or, otherwise, that the balance stays positive over the whole period; it also gives the lowest point. Hover over the curve to read the balance on a given date.

Example: with €900 in the account today, a €2,000 salary on the 1st of each month, €750 rent on the 5th and groceries entered in advance, the curve rises on each 1st and then goes down. If a €1,500 yearly insurance premium is due on February 28, just before the salary, the sentence reads “Balance becomes negative on February 28”: you know in advance that a transfer will be needed.

Clicking the title collapses or expands the section; Pecule remembers this choice and the selected duration. Scheduled transfers from another account to this one (“Linked Account” field, § 13.1) are counted, with the amount received. The Home view uses the same calculation: today's balance, the end-of-month forecast and the “Projected overdraft” alert (first negative day within 30 days) therefore match this curve.

14. Statuses and Payment Methods

14.1 Statuses

Each transaction has a status indicating its current state:

Status	Meaning
Planned	The transaction is anticipated but has not yet occurred. It can be freely modified.
In Progress	The transaction is pending bank validation (e.g., a check that has been issued). It can be freely modified.
Executed	The transaction has been debited or credited on the bank account. Modifications are not possible.

Tip

Change a transaction to "Executed" after verifying it appears on your bank statement. This status locks all data fields except the status itself, to protect data integrity.

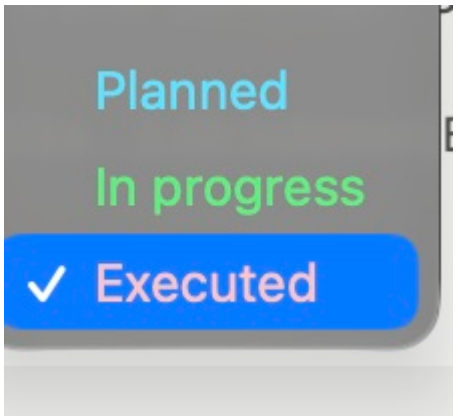

Figure: Selecting a transaction status

14.2 Change Status from the List

Right-click one or more transactions in the list > "Change Status" > choose the new status. This action is possible even for Executed transactions (with confirmation).

14.3 Payment Methods

Payment methods are specific to each account. The default methods include:

- Bank Card
- Bank withdrawal
- Discount
- Cash withdrawal

- Bank transfer
- Check
- Direct debit
- Cash

You can add, edit, or delete payment methods from the account preferences.

When editing a method, its color is picked from twelve predefined swatches or, via “Custom color”, from the free color picker.

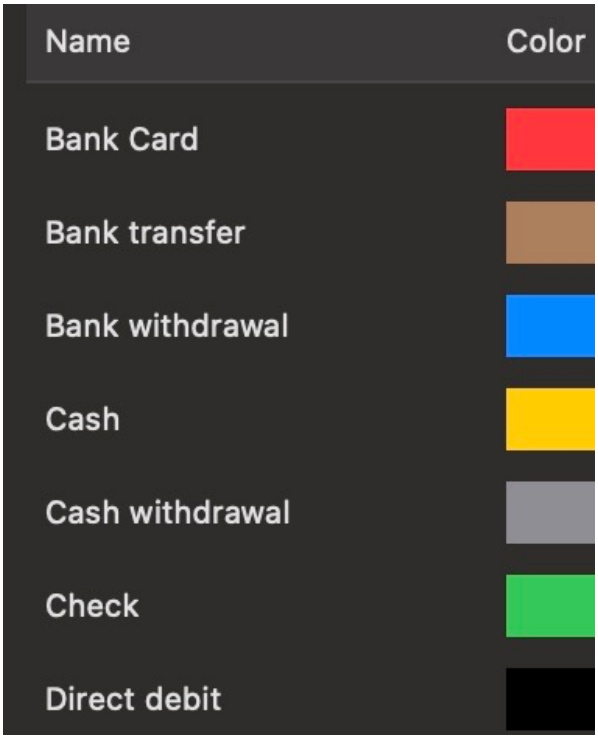

Figure: Configuring payment methods

15. Preferences and Settings

15.1 Application Preferences

Access preferences via the Pecule menu > Preferences (⌘,). The preferences window is organized into three tabs:

15.1.1 General Tab

- Launch at login — enables or disables automatic launch of Pecule at macOS login.
- Notifications — checks the system notification authorization status and offers to open System Settings if disabled.

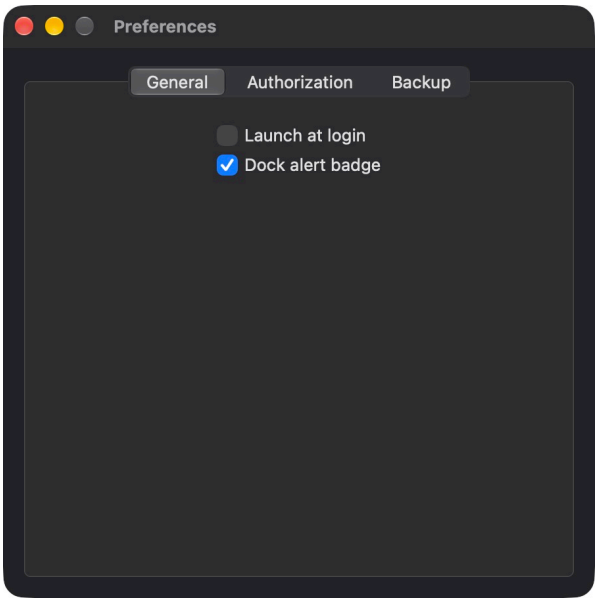

Figure: Application preferences — General tab

15.1.2 Authorization Tab

By default, locking is fully disabled: no authentication is requested at launch and the inactivity timeout is set to "Never". Enable it here if you want to protect access to the application.

- Require authentication at launch — disabled by default; once enabled, authentication (Touch ID, Face ID, or password) is requested every time the app opens.
- Automatic lock timeout — inactivity duration before auto-lock: Never (default), 1, 2, 5, 10, 15, or 30 minutes.
- Lock now — immediately locks the application (available only if authentication is enabled).

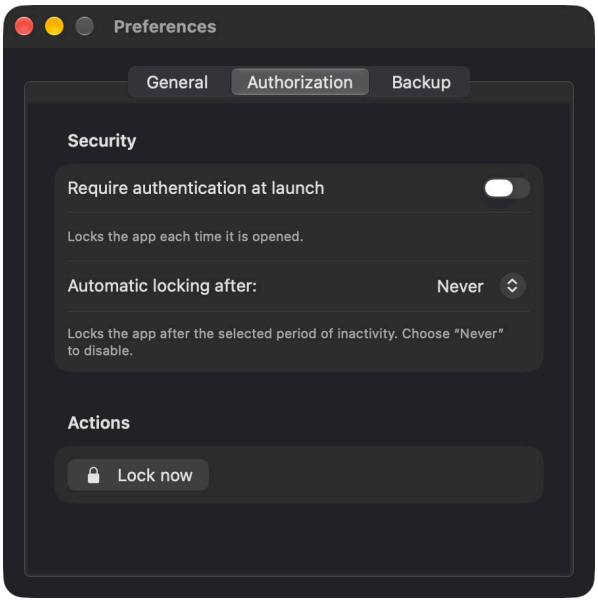

Figure: Application preferences — Authorization tab

15.1.3 Backup Tab

The Backup tab lets you configure the automatic backup policy for your database and trigger a backup at any time.

Setting	Description
Automatic backup	Backup frequency: Never, Daily, Weekly, or Monthly. A backup is triggered automatically when the app opens the database, once the period has elapsed.
Backups to keep	Maximum number of backups to retain (1 to 50). Older backups are deleted automatically when the limit is exceeded.
Backup folder	Destination folder path. Click "Change…" to choose a different location, or click the folder icon to open it in Finder. Default: Documents/PegaseBackups/.
Last backup	Date and time of the last successful backup.

The "Backup Now" button immediately triggers a full backup. A manual backup is also available from the File menu > Backup Now….

Backup structure

Each backup is stored in a subfolder named after the backup (e.g. MyDB_2026-05-20_10-30-00/) inside a folder dedicated to the database (e.g. MyDB Backup/). This subfolder contains the three SQLite files: .store, .store-wal, and .store-shm.

The "Check Integrity" button runs a PRAGMA integrity_check on the open database. A green "Database integrity OK" message confirms the database is healthy; a red message lists any errors detected.

> ⚠ **Tip**
>
> Consider choosing a backup folder on a separate volume (external drive, NAS, or cloud service) to protect against failure of the main disk.

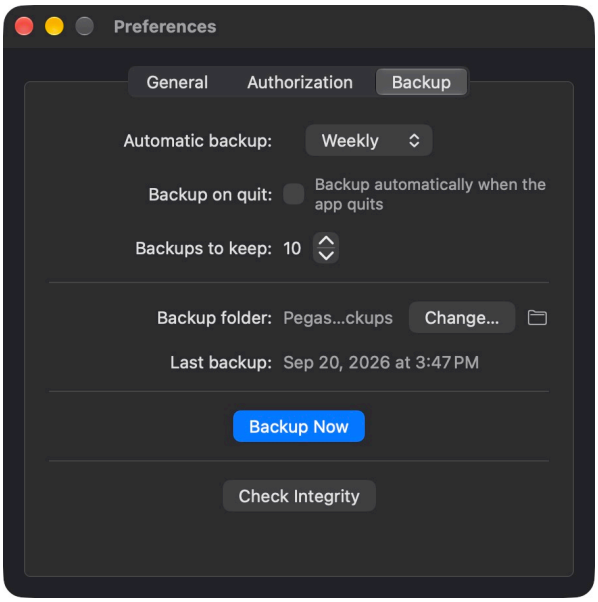

Figure: Preferences — Backup tab

15.1.4 Check Database

The File › Check Database… menu looks for inconsistencies in all accounts of the open database. Nothing is changed until you click “Repair” and confirm “Back up and repair”: a backup of the database is then made automatically before any repair. Unlike the “Check Integrity” button of the Backup tab, which checks the file itself, this tool checks that the data are consistent with each other.

- **Categories:** category missing from its rubric (attached back), listed by another rubric (it stays where it is shown; its link is corrected), empty unused category (deleted).
- **Transactions:** sub-operation without transaction (deleted), transaction without sub-operation (deleted, or only reported if it has an attachment), sub-operation without category (to review: open the transaction and choose a category).
- **Transfers:** missing mirror transaction (the link is removed, the transaction is kept), link one way only (the link back is restored).
- **Schedules:** finished schedule still open (marked as finished).

Problems “to review”, marked with a blue eye, are never repaired automatically and are not counted in the “Repair (N)” button. After a repair, the tool checks again and shows how many problems were fixed.

15.2 Account Parameters

Access the active account's parameters from the sidebar: Reference Account > Settings. The window is organized into four tabs:

- **Rubric:** manage rubrics and categories specific to the account.
- **Payment Method:** customizable list of payment methods.
- **Transaction:** account transaction display preferences.
- **Check:** manage check books.

15.2.1 Rubric Tab

List of rubrics and categories specific to the active account. Each rubric has a name and a color used in charts and the comparative report.

- Click "+" to add a rubric, then enter its name and color.
- Categories are shown under each rubric, with their monthly target (click the triangle to collapse or expand a rubric); select a category to edit or delete it.
- Click "Delete Rubric" to remove the selected rubric. If its categories are used by transactions or schedules, Pecule asks which rubric to move them to ("Move and delete"): nothing is lost, and a category whose name already exists in that rubric is merged into it.
- To sort the categories of each rubric, choose "Name" or "Target" in "Sort categories", above the list; the ↑ / ↓ arrow reverses the order (for example "Target" and ↓ to put the largest targets first). The choice is remembered.
- To move a category to another rubric: right-click the category > "Move to rubric", drag it onto another rubric, or change its rubric in "Edit Category". Its transactions, schedules and savings goals follow it.
- If the chosen rubric already has a category with the same name, Pecule offers to merge them: the transactions, schedules and monthly target go to the existing category (targets are added up, so the total budget does not change).
- Deleting a category in use: Pecule asks for the category that receives its transactions and schedules ("Replace and delete"), instead of leaving them without a category.
- Duplicate names are refused: two rubrics of the same account, or two categories of the same rubric, cannot have the same name (case and spaces ignored). A message says so and "Save" stays greyed out.

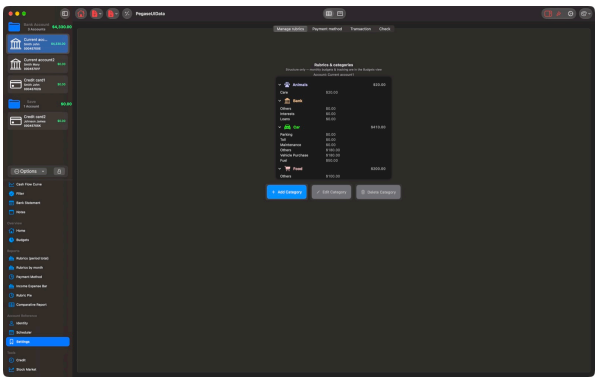

Figure: Account parameters — Rubric tab

15.2.2 Payment Method Tab

List of payment methods available for the active account (card, wire transfer, check, direct debit, cash…). Each account has its own list, independent of other accounts.

- Click "+" to add a payment method.
- Double-click a method to rename it.
- Select a method and click "−" to delete it (if not in use).
- Two payment methods of the same account cannot have the same name (case and spaces ignored).

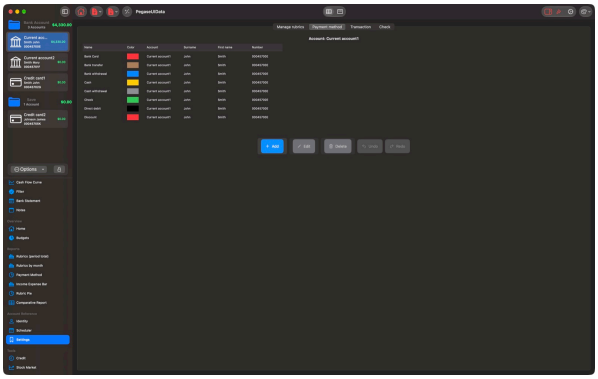

Figure: Account parameters — Payment Method tab

15.2.3 Transaction Tab

Display preferences for transactions, specific to the active account:

- **Group credit card transactions:** groups deferred debit card transactions by month.
- **Split Income / Expense columns:** displays two separate amount columns instead of a single signed column.

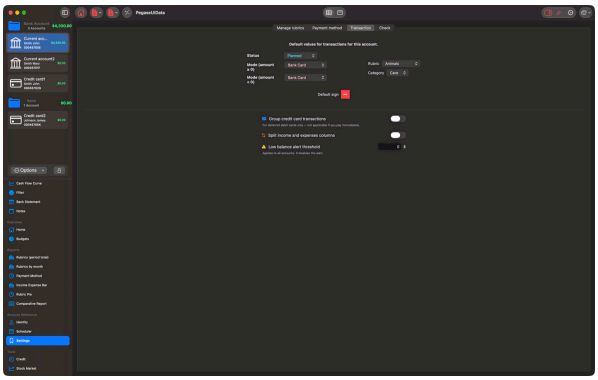

Figure: Account parameters — Transaction tab

15.2.4 Check Tab

Manage check books associated with the account. Lets you track issued check numbers and link them to transactions.

- Click "+" to add a check book by entering the starting number and quantity.
- Check numbers are then available in the transaction entry form.

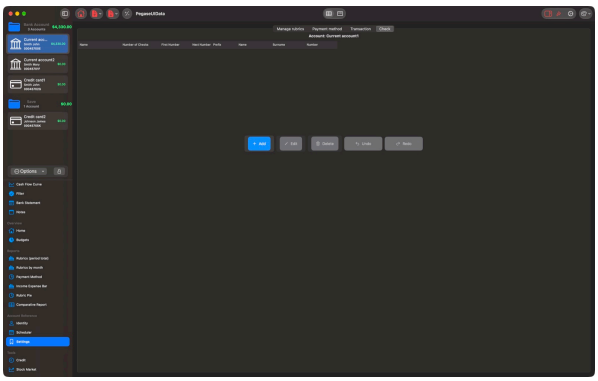

Figure: Account parameters — Check tab

15.3 Account Identities

Access identity information from the sidebar: Reference Account > Identities. The window is organized into three tabs:

- **Account:** opening balances and basic bank account codes.
- **Bank:** full details of the banking institution and advisor contact.
- **Identities:** personal information of the account holder.

15.3.1 Account Tab

- **Initial report —** sets the three opening balances for the account:
- **Executed:** actual opening balance (cleared transactions).
- **Planned:** planned opening balance.
- **In progress:** balance of in-progress transactions.
- Currency — currency in which the account's amounts are shown. Amounts are not converted: only the unit changes (useful for an account created with the wrong currency, or opened in another currency). If the account already has transactions, Pecule asks for confirmation.
- A transfer can only link two accounts in the same currency, as Pecule has no exchange rates: “Linked Account” only offers those accounts, and the currency cannot be changed while the account has transfers or scheduled transfers with an account in another currency.
- **Bank references —** account identification codes:
- **Bank:** bank establishment code.
- **Indicative:** branch sort code.
- **Account:** account number.
- **Key:** RIB key.
- **IBAN:** automatically formatted in groups of 4 characters.
- **BIC:** BIC/SWIFT code of the bank.

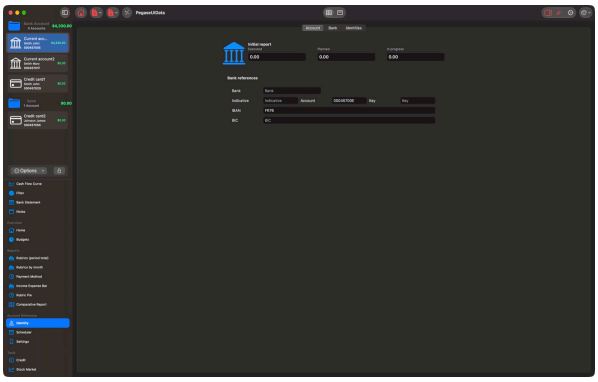

Figure: Account identities — Account tab

15.3.2 Bank Tab

The Bank tab contains the full details of your banking institution, split into two sections:

- **Bank —** institution name and branch postal address (Bank, Address, Complement, Postal Code, Town).
- **Contact —** your bank advisor: Name, Function, Phone.

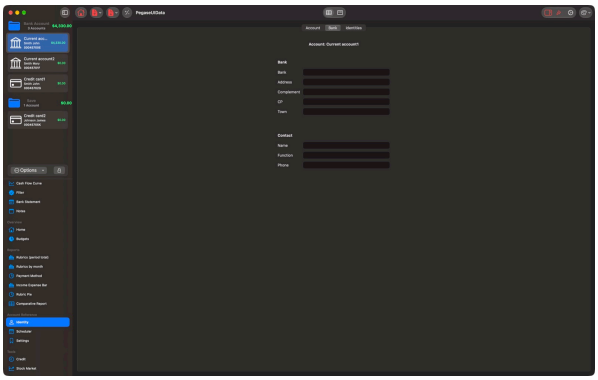

Figure: Account identities — Bank tab

15.3.3 Identities Tab

The Identities tab contains the personal information of the account holder:

- **Name / Surname:** account holder's identity.
- **Address, Complement, Postal Code, Town, Country:** postal address.
- **Phone / Mobile:** phone numbers.
- **Email:** email address.

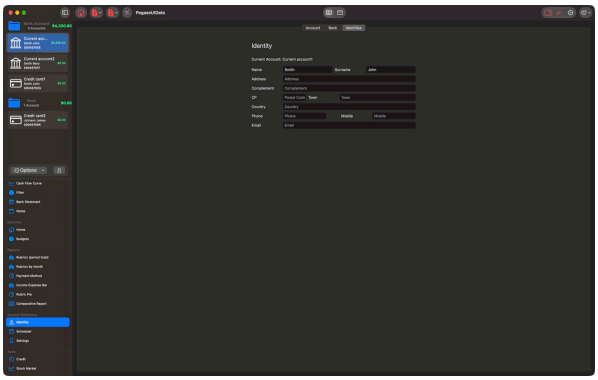

Figure: Account identities — Identities tab

16. Loan Simulator

The Loan Simulator lets you calculate monthly payments and view a full amortization schedule for any mortgage or consumer loan.

16.1 Opening the Simulator

Click "Calcul Credit" (Loan Simulator) in the left sidebar to open the view.

16.2 Entering Parameters

Fill in the four input fields:

- **Amount (EUR)** — the total loan principal, in euros.
- **Annual Interest Rate (%)** — the annual interest rate of the loan.
- **Annual Insurance Rate (%)** — the annual borrower insurance rate (can be 0).
- **Duration (months)** — total loan term in months (e.g., 240 for 20 years).

16.3 Running the Calculation

Click the "Calculate" button. The summary and amortization table appear immediately.

16.4 Reading the Summary

The summary area presents the key loan results:

- **Monthly payment excl. insurance** — monthly principal + interest payment.
- **Monthly payment incl. insurance** — total monthly payment including the insurance premium.
- **Total loan cost** — total amount paid over the entire loan term.
- **Total interest** — total interest paid.
- **Total insurance** — total insurance paid.

16.5 The Amortization Table

The table details each monthly instalment with the following columns:

- **#** — instalment number.
- **Date** — due date of the monthly payment.
- **Payment** — total amount paid this month.
- **Principal** — principal portion repaid.
- **Interest** — interest portion.
- **Insurance** — monthly insurance premium.

- **Remaining Principal** — outstanding principal after this payment.

16.6 Printing the Table

Click the "Print" button to print the summary, the remaining principal curve and the full amortization table. The "Export" menu, at the top right of the simulator, saves the same document as a PDF ("Export as PDF…", also available from the "Export PDF" toolbar button) or the table alone as a CSV file ("Export as CSV…"), one line per installment, ready to open in a spreadsheet.

> **Tip**
>
> To simulate an early repayment, set the amount to your outstanding balance and re-run the calculation with the remaining term.

17. Stock Market

This view exists only in the version of Pecule distributed directly on pecule-app.github.io. It is not part of the Mac App Store version, which works entirely offline.

The Stock Market view lets you track real-time quotes for your favourite securities on the Paris and US markets, directly within Pecule.

17.1 Opening the Stock View

Click "Bourse" (Stock) in the left sidebar. The view displays a price chart, a market selector, and a symbol search field.

17.2 Choosing a Market

Two markets are available:

- **Paris** — Euronext (French stocks quoted in euros).
- **US** — NYSE / NASDAQ (American stocks quoted in dollars).

Click the corresponding button to switch markets. The suggestion list updates automatically.

17.3 Searching for a Security

Type a ticker symbol in the search field or choose from the built-in suggestions:

- **Paris:** AIR (Airbus), BNP, CA (Credit Agricole), CS (AXA), DG (Vinci), EN (Bouygues), FP (TotalEnergies), MC (LVMH), OR (L'Oreal), ORA (Orange), RI (Pernod Ricard), RMS (Hermes), SAF (Safran), SAN (Sanofi), SU (Schneider Electric).
- **US:** AAPL (Apple), AMZN (Amazon), GOOG (Alphabet), META, MSFT (Microsoft), NFLX (Netflix), NVDA, TSLA (Tesla).

Press Enter or click a suggestion to load the chart.

17.4 Selecting a Time Range

Choose the display period using the buttons above the chart:

- **1M** — 1 month
- **3M** — 3 months
- **6M** — 6 months
- **1Y** — 1 year
- **2Y** — 2 years
- **5Y** — 5 years
- **10Y** — 10 years

The suffix "Y" stands for Year · The suffix "M" stands for Month.

17.5 Reading the Chart

The chart shows the closing price evolution over the selected period:

- **Green curve** — the price has risen since the start of the period.
- **Red curve** — the price has fallen since the start of the period.
- A gradient connects each curve to the 0 axis, in the color of its status, and a reference line marks 0: you can see at a glance the periods when the balance goes below zero.
- Hover the mouse over the curve to show a tooltip with the exact date and price.

17.6 Automatic Refresh

Data is automatically reloaded every 15 minutes. No action is required. You can also force a reload by changing the symbol or time range.

17.7 Print

Click the "Print" button to print or export the chart as a PDF using the standard system dialog.

Tip

Stock data is sourced from Yahoo Finance. It is provided for informational purposes only and does not constitute investment advice.

18. Importing and Exporting Transactions

Pecule can import a transaction history and export the active account in CSV format, compatible with Microsoft Excel and Apple Numbers. Import also supports the standard banking formats OFX and QIF.

18.1 Import Transactions (CSV)

CSV import runs through a three-step wizard: Select File → Preview and Map columns → Import. Your file does not have to match Pecule's exact format: you tell Pecule which column of your file maps to which field.

1. Open File > Import > CSV, or simply drag the CSV file onto the application window.
2. Step 1 — Select File: choose the file, then the column separator (Auto, comma ",", semicolon ";", or tab). "Auto" detects the most likely separator.
3. Step 2 — Preview and Map: Pecule shows a preview of the first rows and maps the columns automatically from their headers (Pecule export in all 5 languages, common bank headings such as Date, Description or Amount). Check and, if needed, correct the field chosen for each column (see the table below). Unmapped columns are ignored.
4. The “Check the mapping” box shows in red the required fields that are not mapped (operation date and amount; the Import button stays disabled), and in orange the file columns that will not be imported and the consequences of unmapped fields (default status, category guessed from the label, default payment method, reconciliation date equal to the operation date).
5. Step 3 — Import: run the import. A progress bar shows the status; transactions are added to the active account and saved in batches of 1,000. An interrupted import can be run again: duplicates are skipped.
6. Undo the import: right afterwards, Edit › Undo (⌘Z) removes all the imported transactions at once, without touching the account's other transactions; ⇧⌘Z puts them back. Handy if the file was imported into the wrong account or with the wrong column mapping.

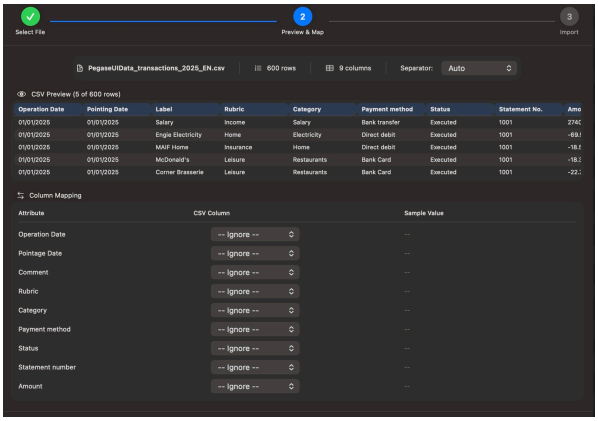

Figure: Column-mapping step during import

18.1.1 Fields to Map

You can map your file's columns to the following fields. Operation Date and Amount are required; the others are optional.

Pecule Field	Description
Operation Date	Transaction date — also used for duplicate detection
Reconciliation Date	Reconciliation or posting date
Label	Transaction description
Rubric	Transaction rubric
Category	Category (if missing, the account's default category is used)
Payment method	Payment method (Card, Check, Transfer…)
Status	Transaction status (Planned, In progress, Executed)
Statement number	Bank statement number
Amount	Amount: negative = expense, positive = income (required)

Automatic Duplicate Detection

During import, a transaction already present on the account (same date, same amount and same label) is skipped automatically: you can re-import a file that overlaps an already-entered period without creating duplicates.

Automatic Categorization (learning)

When the imported file does not specify a category, Pecule guesses it from the transaction label, based on the transactions you have already categorized in this account: an identical label reuses its usual category, and a similar label is recognized from its keywords (the merchant, the provider…).

The app uses no built-in merchant list: it learns from your own habits, whatever your country and language, and improves as you categorize. An unknown label simply receives the account's default category. Automatic categorization can be turned off account by account in Settings › Transaction (“Guess the category on import”); the “Apply to all accounts” button extends the choice to the whole database.

OFX and QIF Import

OFX or QIF statements are imported from the same File > Import menu. These are standard banking formats: there is no column-mapping step. A confirmation screen shows a preview of the transactions (count, period), flags probable duplicates with a “duplicate” badge and offers the option “Also import probable duplicates” (off by default). In OFX, each transaction's bank identifier (FITID) makes it possible to recognize a duplicate with certainty.

As with CSV, an OFX, QIF or PDF bank statement import is undone in one go with Edit › Undo (⌘Z) — the menu reads “Undo OFX Import”, “QIF Import” or “PDF Import” — and ⇧⌘Z redoes it. The account's other transactions are not affected.

18.2 Export Transactions (CSV)

1. Select the account to export in the sidebar.
2. Click the "Export" button in the toolbar (spreadsheet icon), or use File > Export as CSV.
3. A save dialog opens. Choose the location and file name.
4. Click Save.

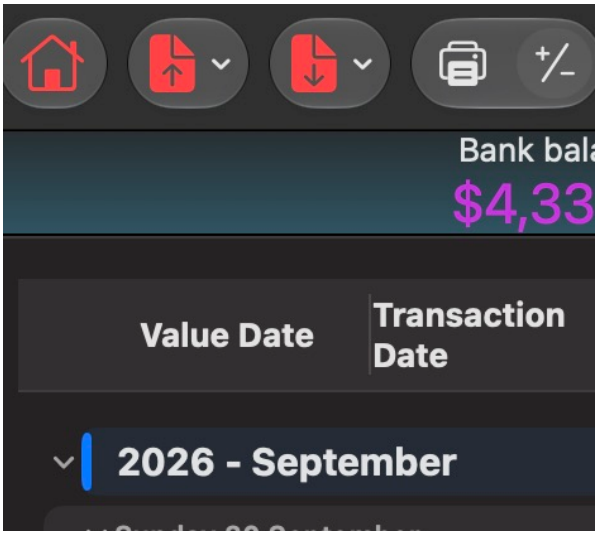

Figure: CSV Export button in the toolbar

18.3 CSV File Format

The generated CSV file follows your Mac's regional settings: the amount uses your locale's decimal separator, and the column separator is chosen so it never collides with it — a semicolon ";" when the decimal separator is a comma (e.g. French), a comma "," otherwise. The header is localized. This is also the simplest format to re-import into Pecule. It contains the following columns:

CSV Column	Description
Operation Date	Transaction date (MM/DD/YYYY or DD/MM/YYYY based on locale)
Reconciliation Date	Reconciliation or posting date
Method	Payment method
Status	Transaction status
Check No.	Check number (if applicable)
Statement No.	Bank statement number
Rubric	Sub-operation rubric
Category	Sub-operation category
Label	Sub-operation description

Amount	Amount with locale-appropriate decimal format

Excel / Numbers Tip

To open the CSV file in Excel: use Data > From Text/CSV and select the matching column separator (a semicolon or a comma, depending on your region). For Numbers on Mac: double-click the file — Numbers automatically detects the format.

19. The Calculator

Pecule includes a floating calculator accessible at all times from the toolbar. It stays visible above all windows without interrupting your current work.

19.1 Open and Close the Calculator

Click the calculator button in the toolbar (± icon). A second click on the same button closes the window. The calculator opens centered on the screen on first launch; subsequently it reappears at its last position.

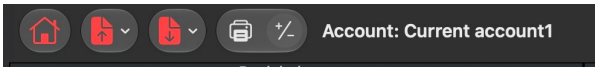

Figure: Calculator button in the toolbar

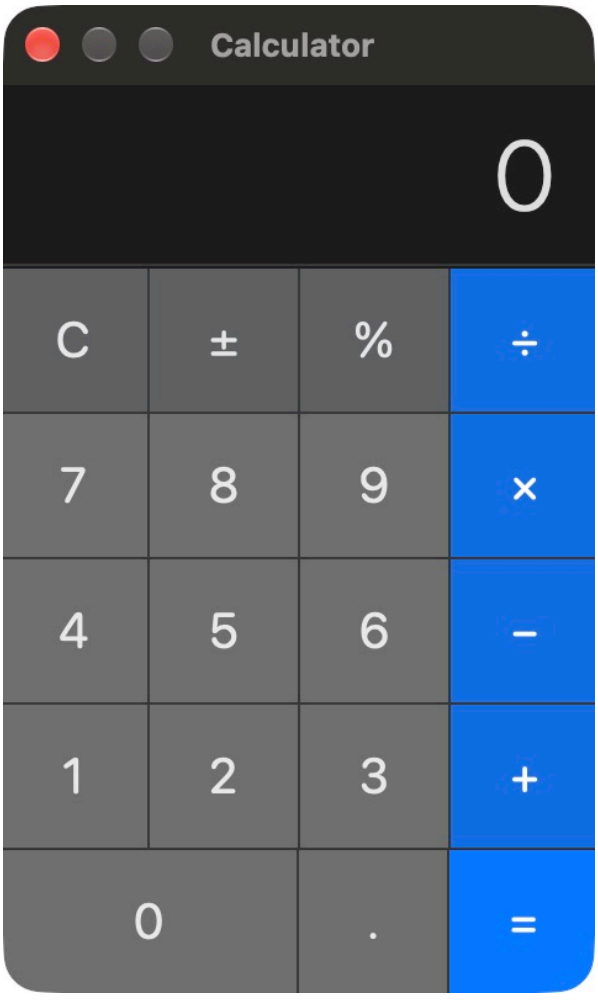

Figure: Floating calculator — overview

19.2 Key Layout

Key	Function

C	Clears everything and resets the calculator to zero
±	Reverses the sign of the displayed number (positive ↔ negative)
%	Converts the number to a percentage (÷ 100). With + or −, calculates the percentage of the accumulator
÷ × − +	Basic arithmetic operations
=	Calculates the result. Pressing again repeats the last operation
.	Enters the decimal point
0 – 9	Digit entry

19.3 Behavior

- Operations can be chained: 3 + 4 × 2 gives 14 (sequential calculation, no operator precedence).
- Pressing = repeatedly repeats the last operation with the same second operand.
- Division by zero returns 0 without an error message.
- The display automatically adapts to the number length (smaller font for long numbers).
- Integers display without a decimal point (e.g., 42 not 42.0).
- The window stays floating above the application without blocking transaction entry.

Tip

You can use the calculator to quickly verify an amount before entering it in a sub-operation, without leaving the entry panel.

20. Keyboard Shortcuts

Shortcut	Action
⌘N	New transaction
⌘S	Save transaction
⌘⌫	Delete selected transaction
⌘D	Duplicate selected transaction
⌘X	Cut selection
⌘C	Copy selection
⌘V	Paste
⌘Z	Undo
⌘⇧Z	Redo
⌘,	Open preferences
⌘1	Transaction list view
⌘2	Filter view
⌘3	Bank Statement view
⌘4	Scheduler view
⌘5	Notes view
⌘E	Export as CSV
⌘P	Print report
⌘L	Lock application
Space	Expand / collapse selection
↑ ↓	Navigate the list
⏎ (double-click)	Open transaction details

21. Troubleshooting

21.1 Common Issues

21.1.1 The transaction list is empty after switching accounts

Verify that transactions have been entered for this account. If the issue persists, close and relaunch the application to force a database reload.

21.1.2 Payment methods or statuses don't appear in the form

Payment method and status lists are specific to each account. If empty, configure them via Account Settings > Payment Methods / Statuses.

21.1.3 The CSV export is empty or incorrect

Verify that the active account contains transactions. If the file opens incorrectly in Excel, use manual import (Data > From Text/CSV) and specify the semicolon separator.

21.1.4 The scheduler doesn't generate transactions

Verify the schedule is active and the next due date has passed. Close and reopen the Scheduler view to trigger automatic processing of overdue schedules.

21.1.5 The app is slow with a large database

If your database contains thousands of transactions, use the Filter view to limit displayed data. Avoid displaying all transactions across multiple years simultaneously.

21.2 Report a Bug or Suggest an Improvement

Your feedback is welcome: bugs, but also suggestions, improvements or new features. Email thierry.hentic@gmail.com.

For a problem, please include if possible:

- Your macOS version
- The exact steps to reproduce the problem
- The error message displayed, if any

For a suggestion, simply describe the use case you'd like or what would make your life easier — every idea helps.

22. Synthesis: Home, Budgets and Savings Goals

The "Synthesis" section of the sidebar gathers three cross-cutting views that give an overall picture of your finances: the "Home" dashboard, "Budgets" tracking and "Savings goals".

22.1 The Home View (Dashboard)

The Home view is the dashboard of the account selected in the sidebar (its name appears under the title): switching accounts updates the whole screen. From top to bottom, it shows:

- **Forecast at month end:** the expected balance at the end of the current month, highlighted, with the current balance below.
- **Alerts:** a banner flags situations to watch — schedules due within seven days, a negative projected balance within 30 days (schedules included), budgets exceeded.
- **Actions to take:** items that call for a decision (projected overdraft, categories over budget, payments due within seven days, savings goals behind schedule); a click opens the relevant view.
- **Indicators:** balance today, end-of-month forecast and the expected change between the two.
- **Top expenses this month:** the three categories with the highest spending this month.
- **50/30/20 split:** the month's spending by family, compared with the target shares (§ 22.2.2).
- **Budgets this month:** the categories over budget, using the same calculation as budget alerts (§ 22.2.3).
- **Savings goals:** up to four goals, with their gauge and the monthly amount to set aside (§ 22.3).
- **Upcoming deadlines:** the next five schedules within thirty days.

Today's balance and the forecast start from the account's opening balance and include transactions already entered as well as upcoming schedules until the end of the month, like the balance projection in the Scheduler (§ 13.8).

22.2 The Budgets View

The Budgets view lets you set a monthly budget per rubric, then continuously compare actual spending against the planned amount. Each rubric that has a budget shows a progress bar indicating how much has already been used, and an overrun is highlighted so it can be spotted immediately; a notification also appears when a category exceeds its budget. Over-budget categories are additionally surfaced on the Home view, linking budget tracking to the account's overall summary. Tracking is per account: one account's transactions never affect another account's budget. Switching accounts in the sidebar immediately recalculates the displayed budget.

22.2.1 Setting up a budget

In Pecule, a rubric's budget is not a value you type in directly: it equals the sum of the monthly objectives of its categories. You therefore set a budget category by category, and the rubric automatically totals them. To set up a budget:

1. Open the Budgets view from the “Summary” section of the sidebar. Budgets apply to the currently selected account; use the ‹ › arrows at the top of the view to change month (the “Today” button returns to the current month).
2. Find the rubric you want to budget, then click the “Details” button (to the right of its progress bar) to expand it.
3. For each category shown, enter the target monthly amount in the field on the right. The value is saved automatically.
4. The rubric's budget updates instantly: it equals the sum of its categories' objectives, and the progress bar shows the percentage already spent for the displayed month.
5. Below the objectives, the “Details” panel also lists the rubric's transactions for the month (date, description, amount) — handy for checking what makes up the realized amount.
6. Collapse the rubric with the “Hide details” button, then repeat for the other rubrics.

Good to know

The month selector at the top of the view compares actual spending against your budget for different months: the objectives stay the same, only the “realized” share changes.

The “realized” amount is the absolute value of the net sum of the rubric's movements for the month: an income rubric (e.g. Income) therefore shows the total of its inflows, and any refunds are deducted from expenses.

The budget is specific to the displayed account: movements from other accounts are never counted.

A rubric with no categories has no objective to enter — create its categories first (account settings).

Until an objective is entered, the rubric shows “No budget set” and its bar stays neutral.

22.2.2 Rubric families and the 50/30/20 rule

To make tracking more meaningful, the Budgets view groups your spending rubrics into three families, following the budgeting guideline known as the “50/30/20 rule”. Each rubric belongs to one of these families, and the view lists them in the order Needs → Wants → Savings (the “Needs” family is expanded by default, the others collapsed to keep the layout compact). Income rubrics (e.g. “Income”) are shown separately and excluded from the 50/30/20 comparison.

Family (target share)	What it groups
Needs — 50%	Essential spending: rent, water, electricity, gas, groceries, health, transport, insurance, phone, loan repayments…
Wants — 30%	Comfort and leisure spending: restaurants, hobbies, outings, shows, entertainment subscriptions, holidays, gifts…
Savings — 20%	What you set aside: savings accounts, home savings, life insurance, investments, scheduled transfers…

The 50/30/20 rule suggests allocating your income by devoting roughly 50% to needs, 30% to wants and 20% to savings. From the month's income, the Budgets view automatically computes each family's target in euros and compares it against your actual spending. For example, for an income of €3,000: €1,500 for needs, €900 for wants and €600 for savings.

Customising the shares

The 50/30/20 rule is only a starting point: the customization button (at the top of the view) lets you adjust the three shares to fit your situation.

Presets are available in one click: 50/30/20, 60/20/20, 45/25/30 and 55/15/30. You can also enter your own percentages, as long as they add up to 100%.

The per-family targets in euros are recalculated immediately from these shares and the month's income.

These 50/30/20 targets (computed from income) are independent of the budget set rubric by rubric (§ 22.2.1, the sum of category objectives): the former gives an overall target, the latter a detailed follow-up.

22.2.3 Budget alerts

Pecule watches every spending category that has an objective: as soon as the current month's spending exceeds that objective (same calculation as the Budgets view, for the displayed account), an alert appears.

- **When you enter a transaction:** when an entry, an edit or an import makes a category go over its budget, a message is shown, for example “Budget exceeded – Home / Groceries: €320 of €300 (+€20)” (rubric / category). It appears only once per category and per month.
- **On the Home view:** the alerts banner, "Actions to take" and the "Budgets this month" card list the categories over budget, in orange, then in red beyond 120% of the budget.
- **In the Dock:** these alerts count in Pecule's icon badge.

Budget alerts can be turned off in the application Preferences (General › “Budget alerts”).

22.3 Savings Goals

The "Savings goals" view ("Synthesis" section of the sidebar) tracks your savings projects: a trip, a new appliance, an emergency fund… Each goal is linked to a category: every transaction of the account in that category, from the start date, counts as a contribution.

- **Create a goal:** click "New goal", then enter a name, the target amount, the target date, the date from which contributions are counted and the category (chosen among the account's categories, grouped by rubric).
- **Read the card:** the gauge shows progress ("€400 of €1,500" and the percentage); on the right is the amount to set aside each month to meet the date, current month included; below, the remaining amount and the number of months left.
- **Status:** "Reached" or "On track" in green; "Behind by …" in orange when contributions are below a regular pace between the start date and the target date; "Deadline passed" in red.
- **Edit or delete:** pencil, double-click or right-click on the card. Deleting only removes the goal, never the transactions.
- **Schedule savings:** the button at the bottom right of the card opens the schedule form, pre-filled: label “Savings – Holiday”, the goal's category, first payment the next day then one per month until the target date, amount rounded up to the euro. The payment is a debit, or a credit if the contributions already made in the category are credits (on a savings account, for example). Check, adjust and save: the schedule appears in the Scheduler, the amount left to live on and the balance projection, and its transactions make the goal progress. Schedules already in the category are shown next to the button.

Example: a €1,500 "Holiday" goal for the end of June, created in early January and linked to the "Holiday savings" category. After two €200 transfers, in March the card shows "€400 of €1,500" (27%) and €275 per month to set aside: €1,100 left over 4 months, March to June. “Schedule savings” then suggests a €275 monthly schedule until June.

The counted amount is the absolute value of the net sum of the category's transactions, as for budgets: a savings transfer recorded as a debit on the current account or as a credit on a savings account counts the same way. Goals are specific to the displayed account.

23. Legal Information and Version

Information	Value
Application	Pecule
Version	2.0
Platform	macOS 14+ (Sonoma and later)
Technology	SwiftUI + SwiftData (Apple)
Developer	Thierry Hentic
Languages	French, English, German, Spanish, Italian, Hebrew, Hindi, Russian
Data Storage	Stored locally on your Mac (no cloud, no external synchronization)

Privacy

Pecule does not collect any personal data. All your financial data is stored exclusively on your Mac, in the local SwiftData database. No information is sent to external servers.
